## FT4232H

### Quad High-Speed USB to Multi- Purpose UART/MPSSE IC

The FT4232H is FTDI's 5<sup>th</sup> generation of USB devices. The FT4232H is a USB 2.0 High Speed (480 Mb/s) to UART/MPSSE ICs. The device features 4 UARTs. Two of these have an option to independently configure an MPSSE engine. This allows the FT4232H to operate as two UART/Bit-Bang ports plus two MPSSE engines used to emulate JTAG, SPI, I<sup>2</sup>C, Bit-bang or other synchronous serial modes. The FT4232H has the following advanced features:

- Single chip USB to quad serial ports with a variety of configurations.
- Entire USB protocol handled on the chip. No USB specific firmware programming required.
- USB 2.0 High Speed (480Mbps/Second) and Full Speed (12Mbps/Second) compatible.
- Two Multi-Protocol Synchronous Serial Engine (MPSSE) on channel A and channel B, to simplify synchronous serial protocol (USB to JTAG, I<sup>2</sup>C, SPI or bit-bang) design.
- Independent Baud rate generators.
- RS232/RS422/RS485 UART Transfer Data Rate up to 12 Mbaud. (RS232 Data Rate limited by external level shifter).
- FTDI's royalty-free Virtual Com Port (VCP) and Direct (D2XX) drivers eliminate the requirement for USB driver development in most cases.
- Optional traffic TX/RX indicators can be added with LEDs and an external 74HC595 shift register.
- Adjustable receive buffer timeout.
- Support for USB suspend and resume conditions via PWREN#, SUSPEND# and RI# pins.
- Highly integrated design includes +1.8 V LDO regulator for VCORE, integrated POR function and on chip clock multiplier PLL (12 MHz – 480 MHz).
- FTDI FT232B style, asynchronous serial UART interface option with full hardware handshaking and modem interface signals.
- Fully assisted hardware or X-On / X-Off software handshaking.
- UART Interface supports 7/8-bit data, 1/2 stop bits, and Odd/Even/Mark/Space/No Parity.
- Auto-transmit enables control for RS485 serial applications using TXDEN pin.
- Operational configuration mode and USB Description strings configurable in external EEPROM over the USB interface.
- Low operating and USB suspend current.
- Configurable I/O drive strength (4, 8, 12 or 16mA) and slew rate.
- Supports bus powered, self-powered and high-power bus powered USB configurations.
- UHCI/OHCI/EHCI host controller compatible.
- USB Bulk data transfer mode (512 byte packets in High-Speed mode).
- Dedicated Windows DLLs available for USB to JTAG, USB to SPI, and USB to I<sup>2</sup>C applications.
- +1.8 V (chip core) and +3.3 V I/O interfacing (+5 V Tolerant).
- Extended -40°C to 85°C industrial operating temperature range.
- Compact 64-LD Lead Free LQFP or QFN package
- Available in compact Pb-free 56 Pin VQFN packages (RoHS compliant)
- +3.3 V single supply operating voltage range.
- ESD protection for FT4232H IO's:  
Human Body Model (HBM) ±2 kV,  
Machine Mode (MM) ±200 V,  
Charge Device Model (CDM) ±500 V,  
Latch-up free.

# 1 Typical Applications

- Single chip USB to four channels UART (RS232, RS422 or RS485) or Bit-Bang interfaces.
- Single chip USB to 2 JTAG channels plus 2 UARTS.
- Single chip USB to 1 JTAG channel plus 3 UARTS.
- Single chip USB to 1 SPI channel plus 3 UARTS.
- Single chip USB to 2 SPI channels plus 2 UARTS.
- Single chip USB to 2 Bit-Bang channels plus 2 UARTS.
- Single chip USB to 1 SPI channel, plus 1 JTAG channel plus 2 UARTS.
- Single chip USB to 2 I<sup>2</sup>C channels plus 2 UARTS.
- Numerous combinations of 4 channels.
- Upgrading Legacy Peripheral Designs to USB.
- Field Upgradable USB Products.
- Cellular and cordless phone USB data transfer cables and interfaces.
- Interfacing MCU / PLD / FPGA based designs to USB.
- PDA to USB data transfer.
- USB Smart Card Readers.
- USB Instrumentation.
- USB Industrial Control.
- USB MP3 Player Interface.
- USB FLASH Card Reader / Writers.
- Set Top Box PC - USB interface.
- USB Digital Camera Interface.
- USB Bar Code Readers.

## 1.1 Driver Support

**Royalty free VIRTUAL COM PORT (VCP) and D2XX Direct Drivers** are available for the following Operating Systems (OS):

- Windows
- Linux
- Mac
- Android (J2xx / D2xx only)

See the following website link for the full driver support list including OS versions and legacy OS.

<https://ftdichip.com/drivers/>

**Virtual COM Port (VCP)** drivers cause the USB device to appear as an additional COM port available to the PC. Application software can access the USB device in the same way as it would access a standard COM port.

**D2XX Direct Drivers** allow direct access to the USB device through a DLL. Application software can access the USB device through a series of DLL function calls. The functions available are listed in the [D2XX Programmer's Guide](#) document which is available from the [Documents](#) section of our website.

Please also refer to the Installation Guides webpage for details on how to install the drivers.

<https://ftdichip.com/document/installation-guides/>

The following additional installation guides, application notes, and technical notes are also available:

- [AN\\_108 Command Processor for MPSSE and MCU Host Bus Emulation Modes](#)
- [AN\\_110 Programmer's Guide for High Speed FTCJTAG DLL](#)
- [AN\\_113 Interfacing FT2232H Hi-Speed Devices to I2C Bus](#)
- [AN\\_114 Interfacing FT2232H Hi-Speed Devices to SPI Bus](#)
- [AN\\_135 MPSSE Basics](#)

## 1.2 Part Numbers

Part Number	Package
FT4232HL-XXXX	64 Pin LQFP
FT4232HQ-XXXX	64 Pin QFN
FT4232H-56Q-XXXX	56 Pin VQFN

**Note:** Packaging codes for xxxx is:

- Reel: Taped and Reel (LQFP = 1000 pcs per reel, QFN-64 = 4000 pcs per reel, QFN-56 = 3000 pcs per reel)
- Tray: Tray packing, (LQFP = 160 pcs per tray, QFN-64 = 260 pcs per tray, QFN-56 = 260 pcs per tray)

Please refer to section 8 for all package mechanical parameters.

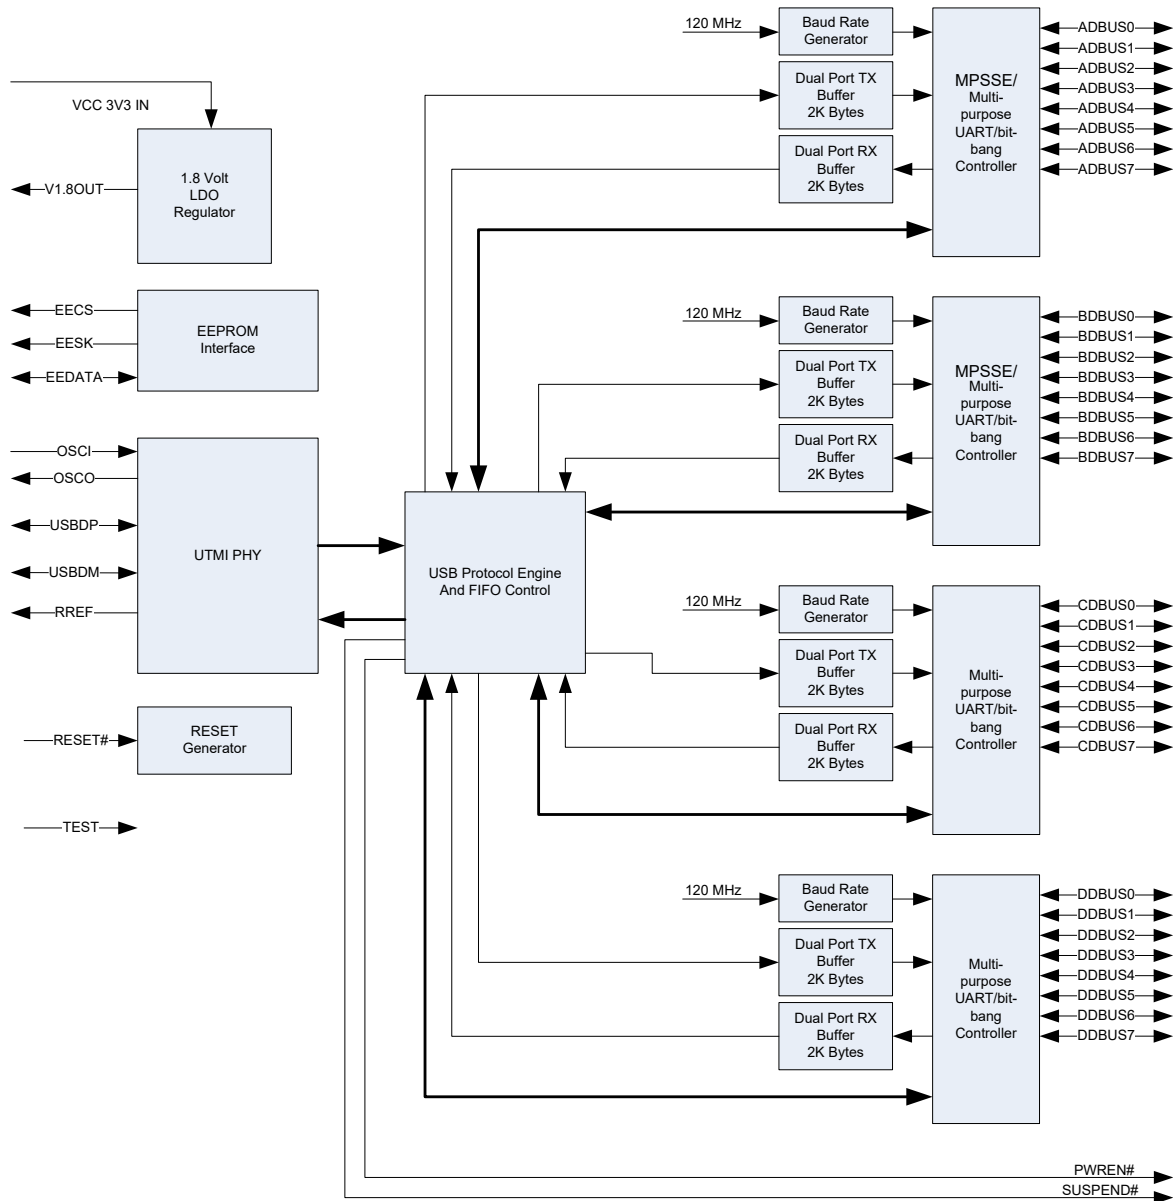

## 1.3 USB Compliant

The FT4232H is fully compliant with the USB 2.0 specification and has been given the USB-IF Test-ID (TID) 40720024.

The timing of the rise/fall time of the USB signals is not only dependant on the USB signal drivers, it is also dependant system and is affected by factors such as PCB layout, external components and any transient protection present on the USB signals. For USB compliance these may require a slight adjustment. This timing can be modified through a programmable setting stored in the same external EEPROM that is used for the USB descriptors. Timing can also be changed by adding appropriate passive components to the USB signals.

## 2 FT4232H Block Diagram

**Figure 2.1 FT4232H Block Diagram**

For a description of each function, please refer to Section 4.

### 3 Device Pin Out and Signal Description

### 3.1 64-pin LQFP and QFN Package

The 64-pin LQFP and 64-pin QFN have the same pin numbering for specific functions. This pin numbering is illustrated in the schematic symbol shown in Figure 3.1.

### 3.1.1 Schematic Symbol

### Figure 3.1 FT4232HL and FT4232HO Schematic Symbol

### 3.1.2 Pin Descriptions

This section describes the operation of the FT4232H pins for 64-pin LQFP and 64-pin QFN. Both the 64-pin QFN and LQFP packages have the same function on each pin. The function of many pins is determined by the configuration of the FT4232H. The following table details the function of each pin dependent on the configuration of the interface. Each of the functions is described in Table 3.1.

**Note:** The convention used throughout this document for active low signals is the signal name followed by #

<b>FT4232HL and FT4232HQ (64-pin)</b>					
<b>Pins</b>		<b>Pin functions (depend on configuration)</b>			
Pin #	Pin Name	ASYNC Serial (RS232)	ASYNC Bit-bang	SYNC Bit-bang	MP SSE

61	EEDATA				

**Table 3.1 FT4232H Pin Configurations for 64-pin QFN and LQFP package**

\* RI# / or TXDEN is selectable in the EEPROM. Default is RI#.

### 3.1.3 Common Pins

The operation of the following FT4232H pins are the same regardless of the configured mode:-

Pin No.	Name	Type	Description
<b>12,37,64</b>	VCORE	POWER Input	+1.8 V input. Core supply voltage input.
<b>20,31,42,56</b>	VCCIO	POWER Input	+3.3 V input. I/O interface power supply input. Failure to connect all VCCIO pins will result in failure of the device.
<b>9</b>	VPLL	POWER Input	+3.3 V input. Internal PHY PLL power supply input. It is recommended that this supply is filtered using an LC filter.
<b>4</b>	VPHY	POWER Input	+3.3 V Input. Internal USB PHY power supply input. Note that this cannot be connected directly to the USB supply. A +3.3V regulator must be used. It is recommended that this supply is filtered using an LC filter.
<b>50</b>	VREGIN	POWER Input	+3.3 V Input. Integrated 1.8 V voltage regulator input.
<b>49</b>	VREGOUT	POWER Output	+1.8 V Output. Integrated voltage regulator output. Connect to VCORE with 3.3 $\mu$ F filter capacitor.
<b>10</b>	AGND	POWER Input	0 V Analog ground.
<b>1,5,11,15, 25,35,47,51</b>	GND	POWER Input	0 V Ground input.

**Table 3.2 Power and Ground for 64-pin QFN and LQFP package**

Pin No.	Name	Type	Description
<b>2</b>	OSCI	INPUT	Oscillator input.
<b>3</b>	OSCO	OUTPUT	Oscillator output.
<b>6</b>	REF	INPUT	Current reference – connect via a 12 K $\Omega$ resistor @ 1% to GND.
<b>7</b>	DM	I/O	USB Data Signal Minus.
<b>8</b>	DP	I/O	USB Data Signal Plus.
<b>13</b>	TEST	INPUT	IC test pin – for normal operation should be connected to GND.
<b>14</b>	RESET#	INPUT	Reset input (active low).
<b>60</b>	PWREN#	OUTPUT	Active low power-enable output. PWREN# = 0: Normal operation. PWREN# = 1: USB SUSPEND mode or device has not been configured. This can be used by external circuitry to power down logic when device is in USB suspend or has not been configured.
<b>36</b>	SUSPEND#	OUTPUT	Active low when USB is in suspend mode.

**Table 3.3 Common Function pins for 64-pin QFN and LQFP Package**

Pin No.	Name	Type	Description
<b>63</b>	EECS	I/O	EEPROM – Chip Select. Tri-State during device reset.

Pin No.	Name	Type	Description
<b>62</b>	EECLK	OUTPUT	Clock signal to EEPROM. Tri-State during device reset. When not in reset, this outputs the EEPROM clock.
<b>61</b>	EEDATA	I/O	EEPROM – Data I/O Connect directly to Data-In of the EEPROM and to Data-Out of the EEPROM via a 2.2 K resistor. Also, pull Data-Out of the EEPROM to VCC via a 10 K resistor for correct operation. Tri-State during device reset.

**Table 3.4 EEPROM Interface Group for 64-pin QFN and LQFP Package**

### 3.1.4 Configured Pins

The following sections describe the function of the configurable pins referred to in Table 3.1 which is determined by how the FT4232H is configured.

#### 3.1.4.1 FT4232H Pins used as an Asynchronous Serial Interface

Any of the 4 channels of the FT4232H can be configured as an asynchronous serial UART interface (RS232/422/485). When configured in this mode, the pins used and the descriptions of the signals are shown in Table 3.5.

Channel A Pin No.	Channel B Pin No.	Channel C Pin No.	Channel D Pin No.	Name	Type	RS232 Configuration Description
<b>16</b>	<b>26</b>	<b>38</b>	<b>48</b>	TXD	OUTPUT	TXD = transmitter output
<b>17</b>	<b>27</b>	<b>39</b>	<b>52</b>	RXD	INPUT	RXD = receiver input
<b>18</b>	<b>28</b>	<b>40</b>	<b>53</b>	RTS#	OUTPUT	RTS# = Ready To send handshake output
<b>19</b>	<b>29</b>	<b>41</b>	<b>54</b>	CTS#	INPUT	CTS# = Clear To Send handshake input
<b>21</b>	<b>30</b>	<b>43</b>	<b>55</b>	DTR#	OUTPUT	DTR# = Data Transmit Ready modem signaling line
<b>22</b>	<b>32</b>	<b>44</b>	<b>57</b>	DSR#	INPUT	DSR# = Data Set Ready modem signaling line
<b>23</b>	<b>33</b>	<b>45</b>	<b>58</b>	DCD#	INPUT	DCD# = Data Carrier Detect modem signaling line
<b>24</b>	<b>34</b>	<b>46</b>	<b>59</b>	RI#/TXDEN	INPUT/OUTPUT	RI# = Ring Indicator Control Input. When the Remote Wake up option is enabled in the EEPROM, taking RI# low can be used to resume the PC USB Host controller from suspend. (see note 1, 2 and 3) TXDEN = (TTL level). For use with RS485 level converters.

**Table 3.5 Channel A, B, C and D Asynchronous Serial Interface Configured Pin Descriptions**

#### Notes:

1. When using remote wake-up, ensure the resistors are pulled-up in suspend. Also ensure peripheral designs do not allow any current sink paths that may partially power the peripheral.
2. If remote wake-up is enabled, a peripheral is allowed to draw up to 2.5 mA in suspend. If remote wake-up is disabled, the peripheral must draw no more than 500  $\mu$ A in suspend.
3. If a Pull-down is enabled, the FT4232H will not wake up from suspend.

#### 3.1.4.2 FT4232H Pins used in a Synchronous or Asynchronous Bit-Bang Interface

The FT4232H channel A, B, C, or channel D can be configured as a bit-bang interface. There are two types of bit-bang modes: synchronous and asynchronous.

When configured in any bit-bang mode (synchronous or asynchronous), the pins used and the descriptions of the signals are shown in Table 3.6.

Channel Number	Pin Nos.	Name	Type	Synchronous or Asynchronous Bit-Bang Configuration Description
A	24,23,22,21, 19,18,17,16	ADBUSB[7:0]	I/O	Channel A, D7 to D0 bidirectional bit-bang data
B	34,33,32,30, 29,28,27,26	BDBUSB[7:0]	I/O	Channel B, D7 to D0 bidirectional bit-bang data
C	46,45,44,43, 41,40,39,38	CDBUSB[7:0]	I/O	Channel C, D7 to D0 bidirectional bit-bang data
D	59,58,57,55 54,53,52,48	DDBUSB[7:0]	I/O	Channel D, D7 to D0 bidirectional bit-bang data

**Table 3.6 Channel A, B, C & D Synchronous/Asynchronous Bit-Bang Configured Pin Descriptions**

For a functional description of this mode, please refer to section 4.5.

### 3.1.4.3 FT4232H pins used in an MP SSE

The FT4232H channel A and channel B, each have a Multi-Protocol Synchronous Serial Engine (MP SSE). Each MP SSE can be independently configured to a number of industry standard serial interface protocols such as JTAG, I<sup>2</sup>C or SPI, or it can be used to implement a proprietary bus protocol. For example, it is possible to use one of the FT4232H's channels (e.g. channel A) to connect to an SRAM configurable FPGA such as supplied by Altera or Xilinx. The FPGA device would normally be un-configured (i.e. have no defined function) at power-up. Application software on the PC could use the MP SSE to download configuration data to the FPGA over USB. This data would define the hardware function on power up. The other MP SSE channel (e.g. channel B) would be available for another serial interface function while channel C and channel D can be configured as UART or bit-bang mode. Alternatively, each MP SSE can be used to control a number of GPIO pins. When configured in this mode, the pins used and the descriptions of the signals are shown in Table 3.7.

Channel A Pin No.	Channel B Pin No.	Name	Type	MP SSE Configuration Description
16	26	TCK/SK	OUTPUT	Clock Signal Output. For example: JTAG – TCK, Test interface clock SPI – SK, Serial Clock
17	27	TDI/DO	OUTPUT	Serial Data Output. For example: JTAG – TDI, Test Data Input SPI – DO, serial data output
18	28	TDO/DI	INPUT	Serial Data Input. For example: JTAG – TDO, Test Data output SPI – DI, Serial Data Input
19	29	TMS/CS	OUTPUT	Output Signal Select. For example: JTAG – TMS, Test Mode Select SPI – CS, Serial Chip Select
21	30	GPIOL0	I/O	General Purpose input/output
22	32	GPIOL1	I/O	General Purpose input/output
23	33	GPIOL2	I/O	General Purpose input/output
24	34	GPIOL3	I/O	General Purpose input/output

**Table 3.7 Channel A and Channel B MP SSE Configured Pin Descriptions**

For a functional description of this mode, please refer to Section 4.4.

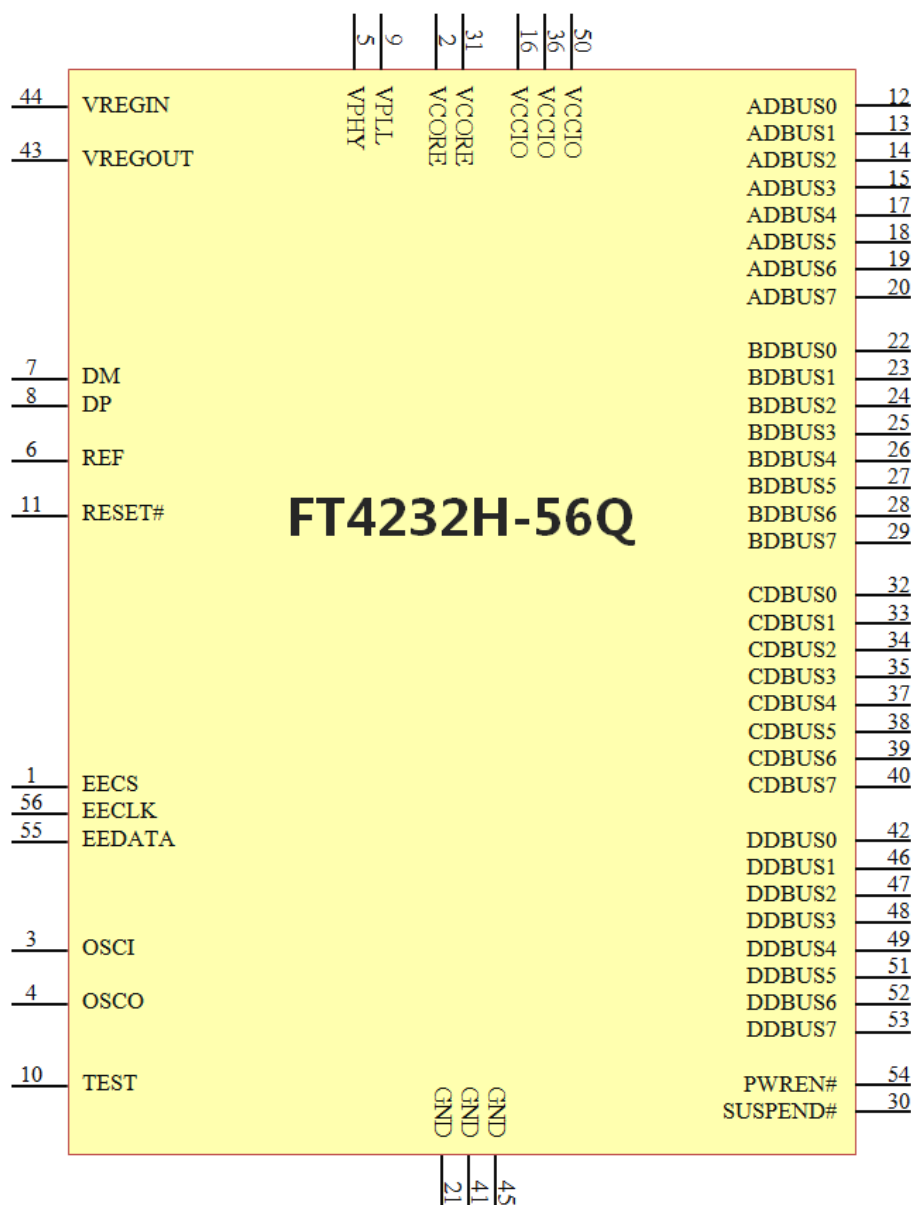

When either Channel A or Channel B or both channels are used in MP SSE mode, Channel C and Channel D can be configured as asynchronous serial interface (RS232/422/485) or Bit-Bang mode or a combination of both.

## 3.2 56-pin VQFN Package

The 56-pin VQFN with lower pin count and small size package is also available for the FT4232H. The differences exist on power/ground and pin number for each pin. The part number is FT4232H-56Q to

distinguish it from the 64-pin package type. All the functions are supported in the 56-pin VQFN package. The pin numbering is illustrated in the schematic symbol shown in Figure 3.2.

### 3.2.1 Schematic Symbol for FT4232H-56Q

**Figure 3.2 FT4232H-56Q Schematic Symbol**

### 3.2.2 Pin Descriptions for FT4232H-56Q

This section describes the operation of the FT4232H-56Q pins for 56-pin VQFN package. The function of many pins is determined by the configuration of the FT4232H-56Q. The following table details the function of each pin dependent on the configuration of the interface. Each of the functions is described in Table 3.8.

**Note:** The convention used throughout this document for active low signals is the signal name followed by #

FT4232H-56Q

\* RI# or TXDEN is selectable in the EEPROM. Default is RI#.

### 3.2.3 Common Pins for FT4232H-56Q

The operation of the following FT4232H-56Q pins are the same regardless of the configured mode:-

Pin No.	Name	Type	Description
<b>2,31</b>	VCORE	POWER Input	+1.8 V input. Core supply voltage input.
<b>16,36,50</b>	VCCIO	POWER Input	+3.3 V input. I/O interface power supply input. Failure to connect all VCCIO pins will result in failure of the device.
<b>9</b>	VPLL	POWER Input	+3.3 V input. Internal PHY PLL power supply input. It is recommended that this supply is filtered using an LC filter.
<b>5</b>	VPHY	POWER Input	+3.3 V Input. Internal USB PHY power supply input. Note that this cannot be connected directly to the USB supply. A +3.3 V regulator must be used. It is recommended that this supply is filtered using an LC filter.
<b>44</b>	VREGIN	POWER Input	+3.3 V Input. Integrated 1.8 V voltage regulator input.
<b>43</b>	VREGOUT	POWER Output	+1.8 V Output. Integrated voltage regulator output. Connect to VCORE with 3.3 $\mu$ F filter capacitor.
<b>21,41,45</b>	GND	POWER Input	0 V Ground input.

**Table 3.9 Power and Ground for 56-pin VQFN package**

Pin No.	Name	Type	Description
<b>3</b>	OSCI	INPUT	Oscillator input.
<b>4</b>	OSCO	OUTPUT	Oscillator output.
<b>6</b>	REF	INPUT	Current reference – connect via a 12 K $\Omega$ resistor @ 1% to GND.
<b>7</b>	DM	INPUT	USB Data Signal Minus.
<b>8</b>	DP	INPUT	USB Data Signal Plus.
<b>10</b>	TEST	INPUT	IC test pin – for normal operation should be connected to GND.
<b>11</b>	RESET#	INPUT	Reset input (active low).
<b>54</b>	PWREN#	OUTPUT	Active low power-enable output. PWREN# = 0: Normal operation. PWREN# = 1: USB SUSPEND mode or device has not been configured. This can be used by external circuitry to power down logic when device is in USB suspend or has not been configured.
<b>30</b>	SUSPEND#	OUTPUT	Active low when USB is in suspend mode.

**Table 3.10 Common Function pins for 56-pin VQFN Package**

Pin No.	Name	Type	Description
<b>1</b>	EECS	I/O	EEPROM – Chip Select. Tri-State during device reset.
<b>56</b>	EECLK	OUTPUT	Clock signal to EEPROM. Tri-State during device reset. When not in reset, this outputs the EEPROM clock.
<b>55</b>	EEDATA	I/O	EEPROM – Data I/O Connect directly to Data-In of the EEPROM and to Data-Out of the EEPROM via a 2.2 K resistor. Also, pull Data-Out of the EEPROM to VCC via a 10 K resistor for correct operation. Tri-State during device reset.

**Table 3.11 EEPROM Interface Group for 56-pin VQFN Package**

### 3.2.4 Configured Pins for FT4232H-56Q

The following sections describe the function of the configurable pins referred to in Table 3.8 which is determined by how the FT4232H-56Q is configured.

#### 3.2.4.1 FT4232H-56Q pins used as an asynchronous serial interface

Any of the 4 channels of the FT4232H-56Q can be configured as an asynchronous serial UART interface (RS232/422/485). When configured in this mode, the pins used and the descriptions of the signals are shown in Table 3.12.

Channel A Pin No.	Channel B Pin No.	Channel C Pin No.	Channel D Pin No.	Name	Type	RS232 Configuration Description
<b>12</b>	<b>22</b>	<b>32</b>	<b>42</b>	TXD	OUTPUT	TXD = transmitter output
<b>13</b>	<b>23</b>	<b>33</b>	<b>46</b>	RXD	INPUT	RXD = receiver input
<b>14</b>	<b>24</b>	<b>34</b>	<b>47</b>	RTS#	OUTPUT	RTS# = Ready To send handshake output
<b>15</b>	<b>25</b>	<b>35</b>	<b>48</b>	CTS#	INPUT	CTS# = Clear To Send handshake input
<b>17</b>	<b>26</b>	<b>37</b>	<b>49</b>	DTR#	OUTPUT	DTR# = Data Transmit Ready modem signaling line
<b>18</b>	<b>27</b>	<b>38</b>	<b>51</b>	DSR#	INPUT	DSR# = Data Set Ready modem signaling line
<b>19</b>	<b>28</b>	<b>39</b>	<b>52</b>	DCD#	INPUT	DCD# = Data Carrier Detect modem signaling line
<b>20</b>	<b>29</b>	<b>40</b>	<b>53</b>	RI#/ TXDEN	INPUT/OUTPUT	RI# = Ring Indicator Control Input. When the Remote Wake up option is enabled in the EEPROM, taking RI# low can be used to resume the PC USB Host controller from suspend. (see note 1, 2 and 3) TXDEN = (TTL level). For use with RS485 level converters.

**Table 3.12 Channel A, B, C & D Asynchronous Serial Interface Configured Pin Desc. for FT4232H-56Q**

#### Notes:

1. When using remote wake-up, ensure the resistors are pulled-up in suspend. Also ensure peripheral designs do not allow any current sink paths that may partially power the peripheral.
2. If remote wake-up is enabled, a peripheral is allowed to draw up to 2.5 mA in suspend. If remote wake-up is disabled, the peripheral must draw no more than 500  $\mu$ A in suspend.
3. If a Pull-down is enabled, the FT4232H will not wake up from suspend.

### 3.2.4.2 FT4232H-56Q pins used in a Synchronous or Asynchronous Bit-Bang Interface

The FT4232H channel A, B, C, or channel D can be configured as a bit-bang interface. There are two types of bit-bang modes: synchronous and asynchronous. When configured in any bit-bang mode (synchronous or asynchronous), the pins used and the descriptions of the signals are shown in Table 3.13.

Channel Number	Pin Nos.	Name	Type	Synchronous or Asynchronous Bit-Bang Configuration Description
A	20,19,18,17, 15,14,13,12	ADBUSB[7:0]	I/O	Channel A, D7 to D0 bidirectional bit-bang data
B	29,28,27,26, 25,24,23,22	BDBUSB[7:0]	I/O	Channel B, D7 to D0 bidirectional bit-bang data
C	40,39,38,37, 35,34,33,32	CDBUSB[7:0]	I/O	Channel C, D7 to D0 bidirectional bit-bang data
D	53,52,51,49 48,47,46,42	DDBUSB[7:0]	I/O	Channel D, D7 to D0 bidirectional bit-bang data

**Table 3.13 Channel A, B, C & D Synchronous/Asynchronous Bit-Bang Configured Pin Description for FT4232H-56Q**

For a functional description of this mode, please refer to Section 4.5.

### 3.2.4.3 FT4232H-56Q pins used in an MPSSE

The FT4232H channel A and channel B, each have a Multi-Protocol Synchronous Serial Engine (MPSSE). Each MPSSE can be independently configured to a number of industry standard serial interface protocols such as JTAG, I2C or SPI, or it can be used to implement a proprietary bus protocol. For example, it is possible to use one of the FT4232H's channels (e.g. channel A) to connect to an SRAM configurable FPGA such as supplied by Altera or Xilinx. The FPGA device would normally be un-configured (i.e. have no defined function) at power-up. Application software on the PC could use the MPSSE to download configuration data to the FPGA over USB. This data would define the hardware function on power up. The other MPSSE channel (e.g. channel B) would be available for another serial interface function while channel C and channel D can be configured as UART or bit-bang mode. Alternatively, each MPSSE can be used to control a number of GPIO pins. When configured in this mode, the pins used and the descriptions of the signals are shown in Table 3.14.

Channel A Pin No.	Channel B Pin No.	Name	Type	MPSSE Configuration Description
12	22	TCK/SK	OUTPUT	Clock Signal Output. For example: JTAG – TCK, Test interface clock SPI – SK, Serial Clock
13	23	TDI/DO	OUTPUT	Serial Data Output. For example: JTAG – TDI, Test Data Input SPI – DO, serial data output
14	24	TDO/DI	INPUT	Serial Data Input. For example: JTAG – TDO, Test Data output SPI – DI, Serial Data Input
15	25	TMS/CS	OUTPUT	Output Signal Select. For example: JTAG – TMS, Test Mode Select SPI – CS, Serial Chip Select
17	26	GPIOL0	I/O	General Purpose input/output
18	27	GPIOL1	I/O	General Purpose input/output
19	28	GPIOL2	I/O	General Purpose input/output
20	29	GPIOL3	I/O	General Purpose input/output

**Table 3.14 Channel A and Channel B MPSSE Configured Pin Description for FT4232H-56Q**

For a functional description of this mode, please refer to Section 4.4.

When either Channel A or Channel B or both channels are used in MPSSE mode, Channel C and Channel D can be configured as asynchronous serial interface (RS232/422/485) or Bit-Bang mode or a combination of both.

## 4 Function Description

The FT4232H is FTDI's 5<sup>th</sup> generation of USB devices. The FT4232H is a USB 2.0 High Speed (480 Mb/s) to UART/MPSSE ICs. It has the capability of being configured in a variety of industry standard serial interfaces.

The FT4232H has four independent configurable interfaces. Two of these interfaces can be configured as UART, JTAG, SPI, I<sup>2</sup>C or bit-bang mode, using an MPSSE, with independent baud rate generators. The remaining two interfaces can be configured as UART or bit-bang.

### 4.1 Key Features

**USB High Speed to Quad Interface.** The FT4232H is a USB 2.0 High Speed (480 Mbits/s) to four independent flexible/configurable serial interfaces.

**Functional Integration.** The FT4232H integrates a USB protocol engine which controls the physical Universal Transceiver Macrocell Interface (UTMI) and handles all aspects of the USB 2.0 High Speed interface. The FT4232H includes an integrated +1.8 V Low Drop-Out (LDO) regulator and 12 MHz to 480 MHz PLL. It also includes 2 Kbytes Tx and Rx data buffers per channel. The FT4232H effectively integrates the entire USB protocol on a chip.

**MPSSE.** Multi-Purpose Synchronous Serial Engines (MPSSE), capable of speeds up to 30 Mbits/s, provides flexible synchronous interface configurations.

**Data Transfer Rate.** The FT4232H supports a data transfer rate up to 12 Mbit/s when configured as an RS232/RS422/RS485 UART interface. Please note the FT4232H does not support the baud rates of 7 Mbaud, 9 Mbaud, 10 Mbaud, and 11 Mbaud.

**Latency Timer.** This is really a feature of the driver and is used to as a timeout to flush short packets of data back to the PC. The default is 16 ms, but it can be altered between 0 ms and 256 ms. At 0ms latency you get a packet transfer on every high-speed micro frame.

### 4.2 Functional Block Descriptions

**Quad Multi-Purpose UART/MPSSE Controllers.** The FT4232H has four independent UART/MPSSE Controllers. These blocks control the UART data or control the Bit-Bang mode if selected by the SETUP command. The blocks used on channel A and channel B also contain a MPSSE (Multi-Protocol Synchronous Serial Engine) in each of them which can be used independently of each other and the remaining UART channels. Using this it can be configured under software command to have 1 MPSSE + 3 UARTS (each UART can be set to Bit Bang mode to gain extra I/O if required) or 2 MPSSE + 2 UARTS.

**USB Protocol Engine and FIFO control.** The USB Protocol Engine controls and manages the interface between the UTMI PHY and the FIFOs of the chip. It also handles power management and the USB protocol specification.

**Dual Port FIFO TX Buffer (2 Kbytes per channel).** Data from the Host PC is stored in these buffers to be used by the Multi-purpose UART/FIFO controllers. This is controlled by the USB Protocol Engine and FIFO control block.

**Dual Port FIFO RX Buffer (2 Kbytes per channel).** Data from the Multi-purpose UART/FIFO controllers is stored in these blocks to be sent back to the Host PC when requested. This is controlled by the USB Protocol Engine and FIFO control block.

**RESET Generator.** The integrated Reset Generator Cell provides a reliable power-on reset to the device internal circuitry at power up. The RESET# input pin allows an external device to reset the FT4232H. RESET# should be tied to VCCIO (+3.3 V) if not being used.

**Independent Baud Rate Generators.** The Baud Rate Generators provides an x16 or an x10 clock input to the UART's from a 120 MHz reference clock and consists of a 14-bit pre-scaler and 4 register bits which provide fine tuning of the baud rate (used to divide by a number plus a fraction). This determines the Baud Rate of the UART which is programmable from 183 baud to 12 million baud. The FT2232H does not support the baud rates of 7 Mbaud, 9 Mbaud, 10 Mbaud, and 11 Mbaud.

See application note [AN232B-05 Configuring FT232R, FT2232 and FT232BM Baud Rates](#) for more details.

**+1.8 V LDO Regulator.** The +1.8 V LDO regulator generates the +1.8 V for the core and the USB transceiver cell. Its input (VREGIN) must be connected to a +3.3 V external power source. It is also recommended to add an external filtering capacitor to the VREGIN. There is no direct connection from the +1.8 V output (VREGOUT) and the internal functions of the FT4232H. The PCB must be routed to connect VREGOUT to the pins that require the +1.8 V including VCORE.

**UTMI PHY.** The Universal Transceiver Macrocell Interface (UTMI) physical interface cell. This block handles the Full speed / High Speed SERDES (serialise – de-serialise) function for the USB TX/RX data. It also provides the clocks for the rest of the chip. A 12 MHz crystal should be connected to the OSCI and OSCO pins. A 12 kΩ resistor should be connected between REF and GND on the PCB.

The UTMI PHY functions include:

- Supports 480 Mbit/s "High Speed" (HS)/ 12 Mbit/s "Full Speed" (FS), FS Only and "Low Speed" (LS).
- SYNC/EOP generation and checking.
- Data and clock recovery from serial stream on the USB.
- Bit-stuffing/unstuffing; bit stuff error detection.
- Manages USB Resume, Wake Up and Suspend functions.
- Single parallel data clock output with on-chip PLL to generate higher speed serial data clocks.

**EEPROM Interface.** When used without an external EEPROM the FT4232H defaults to a quad USB to an asynchronous serial port device. Adding an external 93C46 (93C56 or 93C66) EEPROM allows customization of USB VID, PID, Serial Number, Product Description Strings and Power Descriptor value of the FT4232H for OEM applications. Other parameters controlled by the EEPROM include Remote Wake Up, Soft Pull Down on Power-Off and I/O pin drive strength.

The EEPROM must be a 16-bit wide configuration such as a Microchip 93LC46B or equivalent capable of a 1 Mbit/s clock rate at VCC = +3.00 V to 3.6 V. The EEPROM is programmable in-circuit over USB using a utility program called [FT\\_PROG](#) available from FTDI's web site ([www.ftdichip.com](http://www.ftdichip.com)). This allows a blank part to be soldered onto the PCB and programmed as part of the manufacturing and test process.

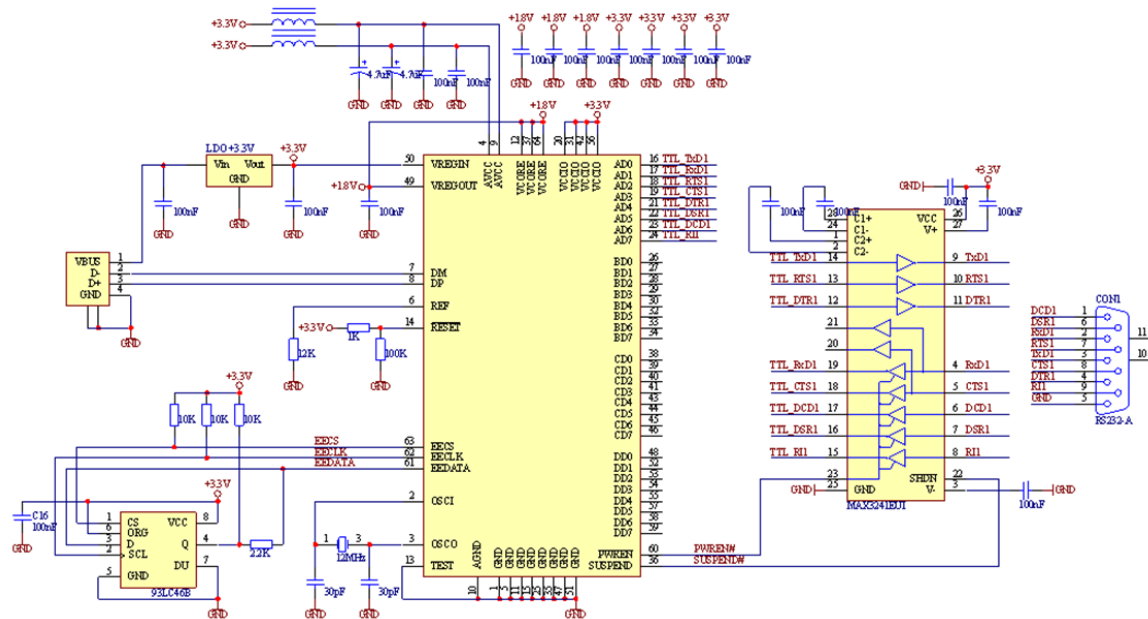

If no EEPROM is connected (or the EEPROM is blank), the FT4232H will default to serial ports. The device uses its built-in default VID (0403), PID (6011) Product Description and Power Descriptor Value. In this case, the device will not have a serial number as part of the USB descriptor.

## 4.3 FT232 UART Interface Mode Description

The FT4232H can be configured in similar UART modes as the FTDI FT232 devices (an asynchronous serial interface). The following examples illustrate how to configure the FT4232H with an RS232, RS422 or RS485 interfaces. The FT4232 can be configured as a mixture of these interfaces.

### 4.3.1 RS232 Configuration

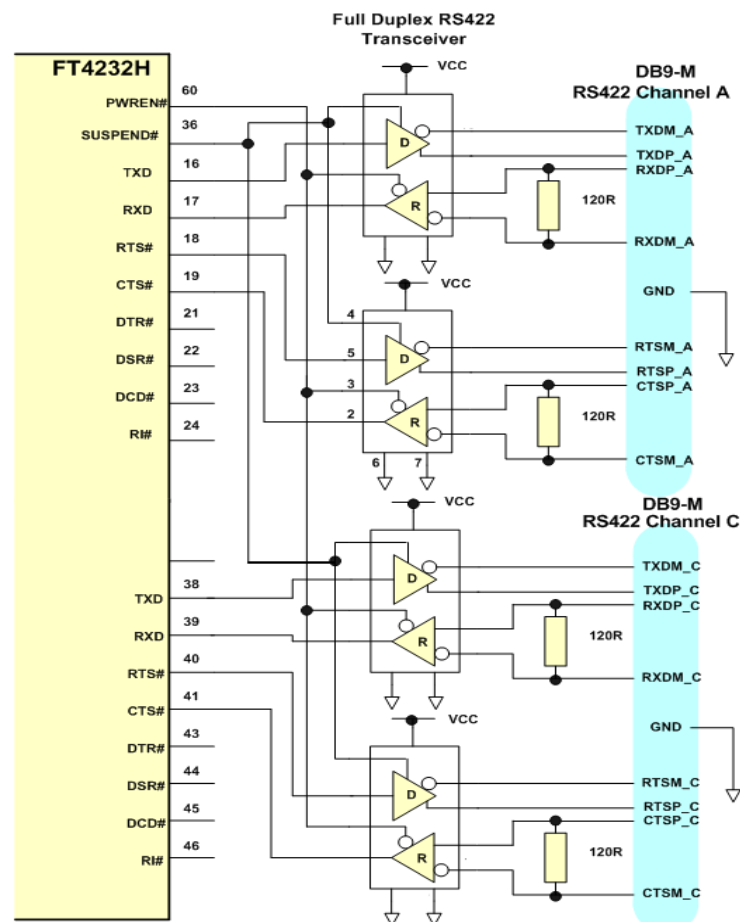

Figure 4.1 illustrates how the FT4232H channel A can be configured with an RS232 UART interface. This can be repeated for channels B, C and D to provide a quad RS232, but has been omitted for clarity.

**Figure 4.1 RS232 Configuration**

### 4.3.2 RS422 Configuration

Figure 4.2 illustrates how the FT4232H can be configured as a dual RS422 interface. The FT4232H can have all 4 channels connected as RS422, but only channel A and channel C are shown for clarity.

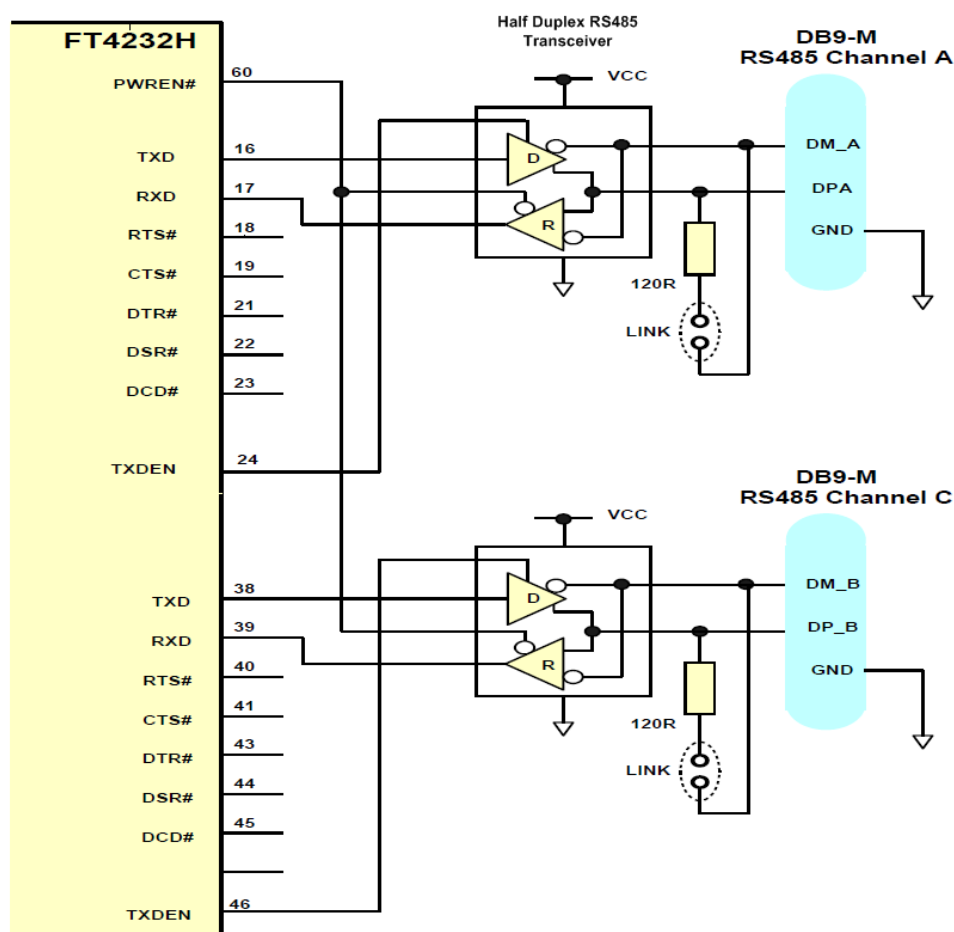

**Figure 4.2 Dual RS422 Configurations**

In this case both channel A and channel C are configured as UART operating at TTL levels and a level converter device (full duplex RS485 transceiver) is used to convert the TTL level signals from the FT4232H to RS422 levels. The PWREN# signal is used to power down the level shifters such that they operate in a low quiescent current when the USB interface is in suspend mode.

### 4.3.3 RS485 Configuration

Figure 4.3 illustrates how the FT4232H can be configured as a dual RS485 interface. The FT4232H can have all 4 channels connected as RS485, but only channel A and channel C are shown for clarity.

**Figure 4.3 Dual RS485 Configurations**

In this case both channel A and channel C are configured as RS485 operating at TTL levels and a level converter device (half duplex RS485 transceiver) is used to convert the TTL level signals from the FT4232H to RS485 levels. It has separate enables on both the transmitter and receiver. With RS485, the transmitter is only enabled when a character is being transmitted from the UART. The TXDEN pins on the FT4232H are provided for exactly that purpose, and so the transmitter enables are wired to the TXDEN's. The receiver enable is active low, so it is wired to the PWREN# pin to disable the receiver when in USB suspend mode.

RS485 is a multi-drop network – i.e. many devices can communicate with each other over a single two wire cable connection. The RS485 cable requires to be terminated at each end of the cable. Links are provided to allow the cable to be terminated if the device is physically positioned at either end of the cable.

In this example the data transmitted by the FT4232H is also received by the device that is transmitting. This is a common feature of RS485 and requires the application software to remove the transmitted data from the received data stream. With the FT4232H it is possible to do this entirely in hardware – simply modify the schematic so that RXD of the FT4232H is the logical OR of the level converter device receiver output with TXDEN using an HC32 or similar logic gate.

## 4.4 MPSSSE Interface Mode Description

MPSSSE Mode is designed to allow the FT4232H to interface efficiently with synchronous serial protocols such as JTAG, I2C and SPI Bus. It can also be used to program SRAM based FPGA's over USB. The MPSSSE interface is designed to be flexible so that it can be configured to allow any synchronous serial protocol (industry standard or proprietary) to be implemented using the FT4232H. MPSSSE is only available on channel A and channel B.

MPSSSE is fully configurable and is programmed by sending commands down the data stream. These can be sent individually or more efficiently in packets. MPSSSE is capable of a maximum sustained data rate of 30 Mbits/s.

When a channel is configured in MPSSSE mode, the IO timing and signals used are shown in Figure 4.4 and Table 4.1. These show timings for TCK=30MHz. TCK can be divided internally to provide a slower clock.

**Figure 4.4 MPSSSE Signal Waveforms**

NAME	MIN	NOM	MAX	UNITS	COMMENT
t1		33.33		ns	TCK period
t2	15	16.67		ns	TCK high period
t3	15	16.67		ns	TCK low period
t4	1		7.15	ns	TCK to TDI/DO delay
t5	0			ns	TDO/DI hold time
t6			11	ns	TDO/DI setup time

**Table 4.1 MPSSSE Signal Timings**

MPSSSE mode is enabled using Set Bit Bang Mode driver command. A hex value of 2 will enable it, and a hex value of 0 will reset the device. See application note [AN2232-02 Bit Mode Functions for the FT2232](#) for more details and examples.

The MPSSSE command set is fully described in application note [AN 108 Command Processor for MPSSSE and MCU Host Bus Emulation Modes](#).

The following additional application notes are available for configuring the MPSSSE:

- [AN 110 Programmers Guide for High-Speed FTCJTAG DLL](#)
- [AN 177 User Guide for LibMPSSSE-I2C](#)
- [AN 178 User Guide for LibMPSSSE-SPI](#)

### 4.4.1 MPSSE Adaptive Clocking

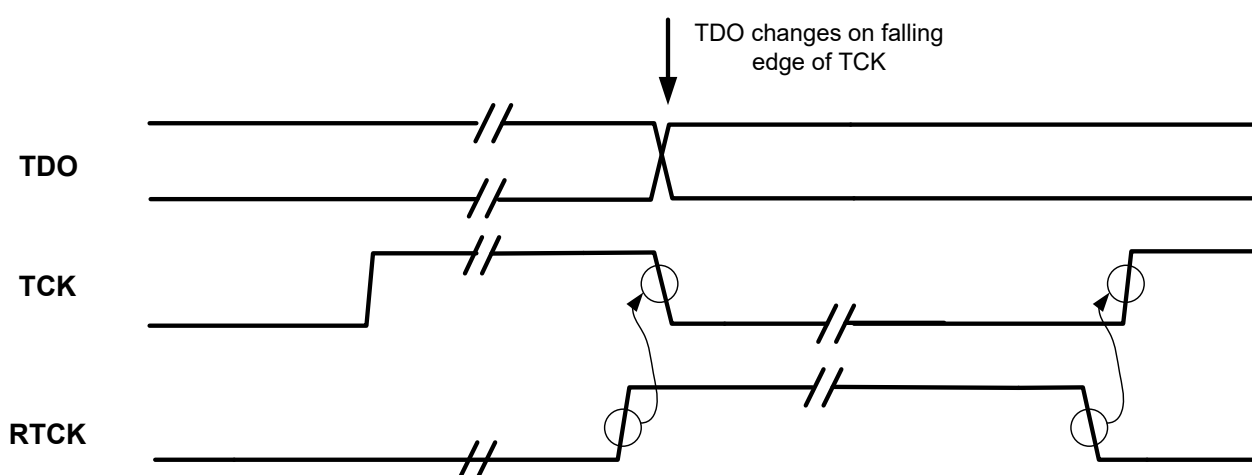

Adaptive clocking is a new MPSSE feature added to the FT24232H MPSSE engine.

The mode is effectively handshaking the CLK signal with a return clock RTCK. This is a technique used by ARM processors.

The FT4232H will assert the CLK line and wait for the RTCK to be returned from the target device to GPIOL3 line before changing the TDO (data out line).

**Figure 4.5 Adaptive Clocking Interconnect**

**Figure 4.6: Adaptive Clocking waveform**

Adaptive clocking is not enabled by default.

See: [AN\\_108 Command Processor For MPSSE and MCU Host Bus Emulation Modes.](#)

## 4.5 Synchronous & Asynchronous Bit-Bang Interface Mode Desc.

The FT4232H channel A, B, C, or channel D can be configured as a bit-bang interface. There are two types of bit-bang modes: synchronous and asynchronous.

### 4.5.1 Asynchronous Bit-Bang Mode

Asynchronous Bit-Bang mode is the same as BM-style Bit-Bang mode. On any channel configured in asynchronous bit-bang mode, data written to the device in the normal manner will be self-clocked onto the parallel I/O data pins (those which have been configured as outputs). Each I/O pin can be independently set as an input or an output. The rate that the data is clocked out at is controlled by the baud rate generator.

For the data to change there has to be new data written, and the baud rate clock has to tick. If no new data is written to the channel, the pins will hold the last value written.

### 4.5.2 Synchronous Bit-Bang Mode

The synchronous Bit-Bang mode will only update the output parallel I/O port pins whenever data is sent from the USB interface to the parallel interface. When this is done, data is read from the USB Rx FIFO buffer and written out on the pins. Data can only be received from the parallel pins (to the USB Tx FIFO interface) when the parallel interface has been written to.

With Synchronous Bit-Bang mode, data will only be sent out by the FT4232H if there is space in the FT4232H USB TXFIFO for data to be read from the parallel interface pins. This Synchronous Bit-Bang mode will read the data bus parallel I/O pins first before it transmits data from the USB RxFIFO. It is therefore 1 byte behind the output, and so to read the inputs for the byte that you have just sent, another byte must be sent.

For example:-

(1) Pins start at 0xFF  
Send 0x55,0xAA  
Pins go to 0x55 and then to 0xAA  
Data read = 0xFF,0x55

(2) Pins start at 0xFF  
Send 0x55,0xAA,0xAA  
(repeat the last byte sent)  
Pins go to 0x55 and then to 0xAA

Data read = 0xFF,0x55,0xAA

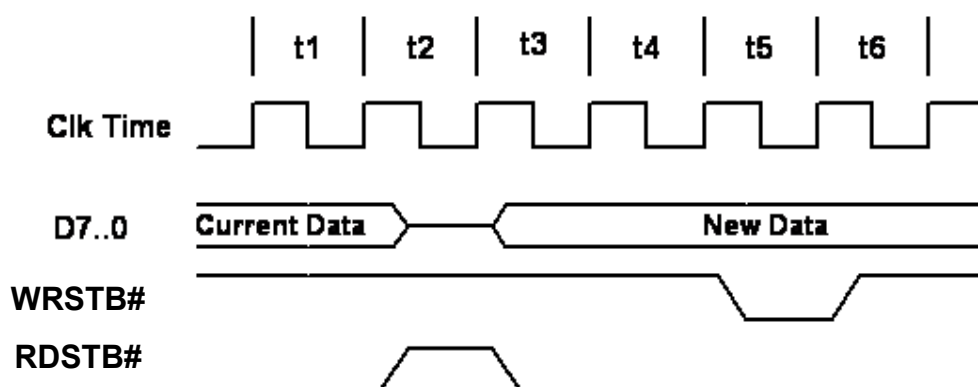

Synchronous Bit-Bang Mode differs from Asynchronous Bit-Bang mode in that the device parallel output is only read when the parallel output is written to by the USB interface. This makes it easier for the controlling program to measure the response to a USB output stimulus as the data returned to the USB interface is synchronous to the output data.

Asynchronous Bit-Bang mode is enabled using Set Bit Bang Mode driver command. A hex value of 1 will enable Asynchronous Bit-Bang mode.

Synchronous Bit-Bang mode is enabled using Set Bit Bang Mode driver command. A hex value of 4 will enable Synchronous Bit-Bang mode.

See application note [AN2232-02 Bit Mode Functions for the FT232R](#) for more details and examples of using the bit-bang modes.

An example of the synchronous bi-bang mode timing is shown in Figure 4.7 and Table 4.2.

**Figure 4.7 Synchronous Bit-Bang Mode Timing Interface Example**

It should be noted that the FT4232H does not output the WRSTB# or RDSTB# signals when configured in bit-bang mode. Figure 4.7 and Table 4.2 show these signals for **illustration** purposes only.

NAME	Description
t1	Current pin state is read
t2	RDSTB# is set inactive and data on the parallel I/O pins is read and sent to the USB host.
t3	RDSTB# is set active again, and any pins that are output will change to their new data.
t4	1 clock cycle to allow for data setup.
t5	WRSTB# goes active. This indicates that the host PC has written new data to the I/O parallel data.
t6	WRSTB# goes inactive.

**Table 4.2 Synchronous Bit-Bang Mode Timing Interface Example Timings**

WRSTB# = this output indicates when new data has been written to the I/O pins from the Host PC (via the USB interface).

RDSTB# = this output rising edge indicates when data has been read from the I/O pins and sent to the Host PC (via the USB interface).

## 4.6 FT4232H Mode Selection

The 4 channels of the FT4232H reset to 4 asynchronous serial UART interfaces. Following a reset, the required mode can be configured by sending the **FT\_SetBitMode** command (refer to [D2XX Programmers Guide](#)) to the USB driver software.

The EEPROM contents have no effect on the selected mode with the exception of selecting the TXDEN for RS485 mode when asynchronous serial interface has been selected in software. If the device is reset, then the 4 channels must be reconfigured into the required mode.

Note that the mode of each of the 4 channels is independent of the other channels.

The MPSSE can be configured directly using the D2XX commands. Refer to [D2XX Programmers Guide](#) for more details.

Also the MPSSE command set is fully described in application note [AN\\_108 Command Processor for MPSSE and MCU Host Bus Emulation Modes](#).

## 5 Devices Characteristics and Ratings

### 5.1 Absolute Maximum Ratings

The absolute maximum ratings for the FT4232H devices are as follows. These are in accordance with the Absolute Maximum Rating System (IEC 60134). Exceeding these values may cause permanent damage to the device.

Parameter	Value	Unit
Storage Temperature	-65°C to 150°C	Degrees C
Floor Life (Out of Bag) At Factory Ambient (30°C / 60% Relative Humidity)	168 Hours (IPC/JEDEC J-STD-033A MSL Level 3 Compliant)*	Hours
Ambient Operating Temperature (Power Applied)	-40°C to 85°C	Degrees C
MTTF FT4232HL / FT4232HQ / FT4232H-56Q	9,110,463	Hours
VCORE Supply Voltage	-0.3 to +2.0	V
VCCIO IO Voltage	-0.3 to +4.0	V
DC Input Voltage – USBDP and USBDM	-0.5 to +3.63	V
DC Input Voltage – High Impedance Bi-directional (powered from VCCIO)	-0.3 to +5.8	V
DC Input Voltage – All Other Inputs	-0.5 to + (VCCIO +0.5)	V
DC Output Current – Outputs	16	mA

**Table 5.1 Absolute Maximum Ratings**

\* If devices are stored out of the packaging beyond this time limit the devices should be baked before use. The devices should be ramped up to a temperature of +125°C and baked for up to 17 hours.

### 5.2 DC Characteristics

DC Characteristics (Ambient Temperature = -40°C to +85°C).

Parameter	Description	Minimum	Typical	Maximum	Units	Conditions
VCORE	VCC Core Operating Supply Voltage	1.62	1.80	1.98	V	
VCCIO*	VCCIO Operating Supply Voltage	2.97	3.30	3.63	V	Cells are 5 V tolerant
VREGIN	VREGIN Voltage regulator Input	3.00	3.30	3.60	V	
VREGOUT	Voltage regulator Output	1.71	1.80	1.89	V	
Ireg	Regulator Current			150	mA	VREGIN +3.3 V
Icc1	Core Operating Supply Current	---	70	---	mA	VCORE = +1.8 V Normal Operation
Icc1r	Core Reset Supply Current	---	5	---	mA	VCORE = +1.8 V Device in reset state.
Icc1s	Core Suspend Supply Current		500		μA	VCORE = +1.8 V USB Suspend

**Table 5.2 Operating Voltage and Current**

**Note:** Failure to connect all VCCIO pins will result in failure of the device.

The I/O pins are +3.3 V cells, which are +5 V tolerant (except the USB PHY pins).

Parameter	Description	Minimum	Typical	Maximum	Units	Conditions
Voh	Output Voltage High	2.40	3.14		V	Ioh = +/-2 mA I/O Drive strength* = 4 mA
			3.20		V	I/O Drive strength* = 8 mA
			3.22		V	I/O Drive strength* = 12 mA
			3.22		V	I/O Drive strength* = 16 mA
Vol	Output Voltage Low		0.18	0.40	V	Iol = +/-2 mA I/O Drive strength* = 4 mA
			0.12		V	I/O Drive strength* = 8 mA
			0.08		V	I/O Drive strength* = 12 mA
			0.07		V	I/O Drive strength* = 16 mA
Vil	Input low Switching Threshold		-	0.80	V	LVTTL
Vih	Input High Switching Threshold	2.0	-		V	LVTTL
Vt	Switching Threshold		1.50		V	LVTTL
Vt-	Schmitt trigger negative going threshold voltage	0.80	1.10	-	V	
Vt+	Schmitt trigger positive going threshold voltage		1.60	2.0	V	
Rpu	Input pull-up resistance	40	75	190	KΩ	Vin = 0
Rpd	Input pull-down resistance	40	75	190	KΩ	Vin = VCCIO
Iin	Input Leakage Current	15	45	85	μA	Vin = 0
Ioz	Tri-state output leakage current		+/-10		μA	Vin = 5.5 V or 0

**Table 5.3 I/O Pin Characteristics (except USB PHY pins)**

\*The I/O drive strength and slow slew-rate are configurable in the EEPROM.

DC Characteristics (Ambient Temperature = -40°C to +85°C).

Parameter	Description	Minimum	Typical	Maximum	Units	Conditions
VPHY, VPLL	PHY Operating Supply Voltage	3.0	3.3	3.6	V	3.3 V I/O
Iccphy	PHY Operating Supply Current	---	30	60	mA	High-speed operation at 480 MHz
Iccphy (susp)	PHY Operating Supply Current	---	10	50	μA	USB Suspend

**Table 5.4 PHY Operating Voltage and Current**

Parameter	Description	Minimum	Typical	Maximum	Units	Conditions
V <sub>oh</sub>	Output Voltage High	V <sub>CORE</sub> -0.2			V	
V <sub>ol</sub>	Output Voltage Low			0.2	V	
V <sub>il</sub>	Input low Switching Threshold		-	0.8	V	
V <sub>ih</sub>	Input High Switching Threshold	2.0	-		V	

**Table 5.5 PHY I/O Pin Characteristics**

### 5.3 ESD Tolerance

ESD protection for FT4232H IO's.

Parameter	Reference	Minimum	Typical	Maximum	Units
Human Body Model (HBM)	JEDEC EIA/JESD22-A114-B, Class 2		±2 kV		kV
Machine Mode (MM)	JEDEC EIA/JESD22-A115-A, Class B		±200 V		V
Charge Device Model (CDM)	JEDEC EIA/ JESD22-C101-D, Class-III		±500 V		V
Latch-up	JESD78, Trigger Class-II		±200 mA		mA

**Table 5.6 ESD Tolerance**

### 5.4 Thermal Characteristics

Parameter	Minimum	Typical	Maximum	Units
Θ <sub>JA</sub> (FT4232HL)		37.66		°C/W
Θ <sub>JC</sub> (FT4232HL)		8.39		°C/W
Θ <sub>JA</sub> (FT4232HQ)		29.67		°C/W
Θ <sub>JC</sub> (FT4232HQ)		14.12		°C/W
T <sub>J</sub> (FT4232HL/FT4232HQ)	-40	25	125	°C

**Table 5.7 Thermal Characteristics**

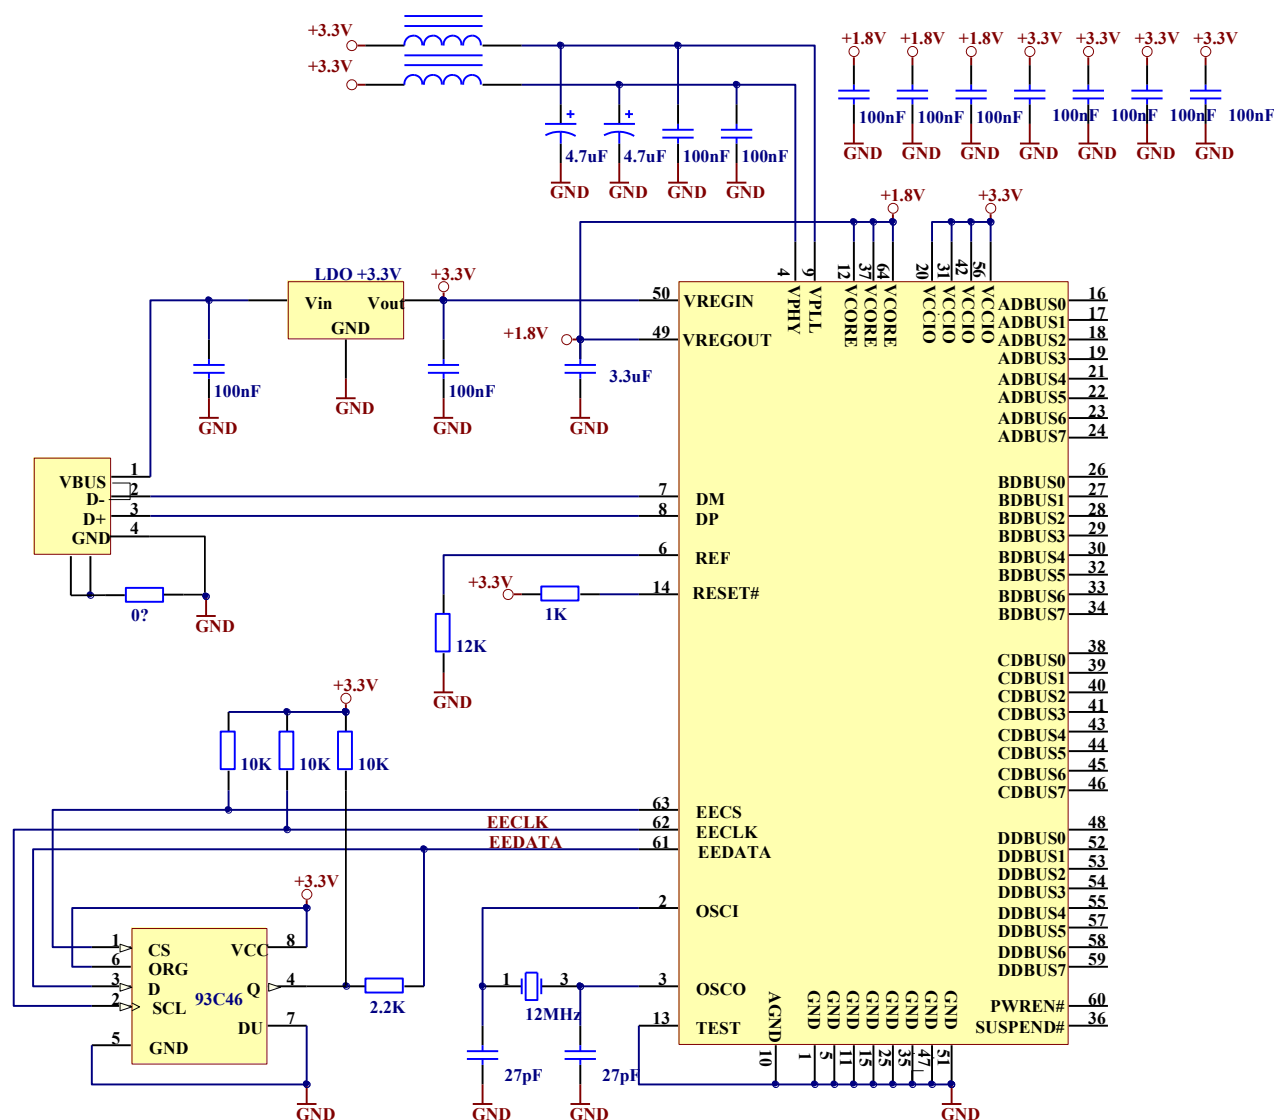

## 6 FT4232H Configurations

The following sections illustrate possible USB power configurations for the FT4232H.

All USB power configurations illustrated apply to both package options for the FT4232H device.

## 6.1 USB Bus Powered Configuration

### Bus Powered Application example 1: Bus powered configuration

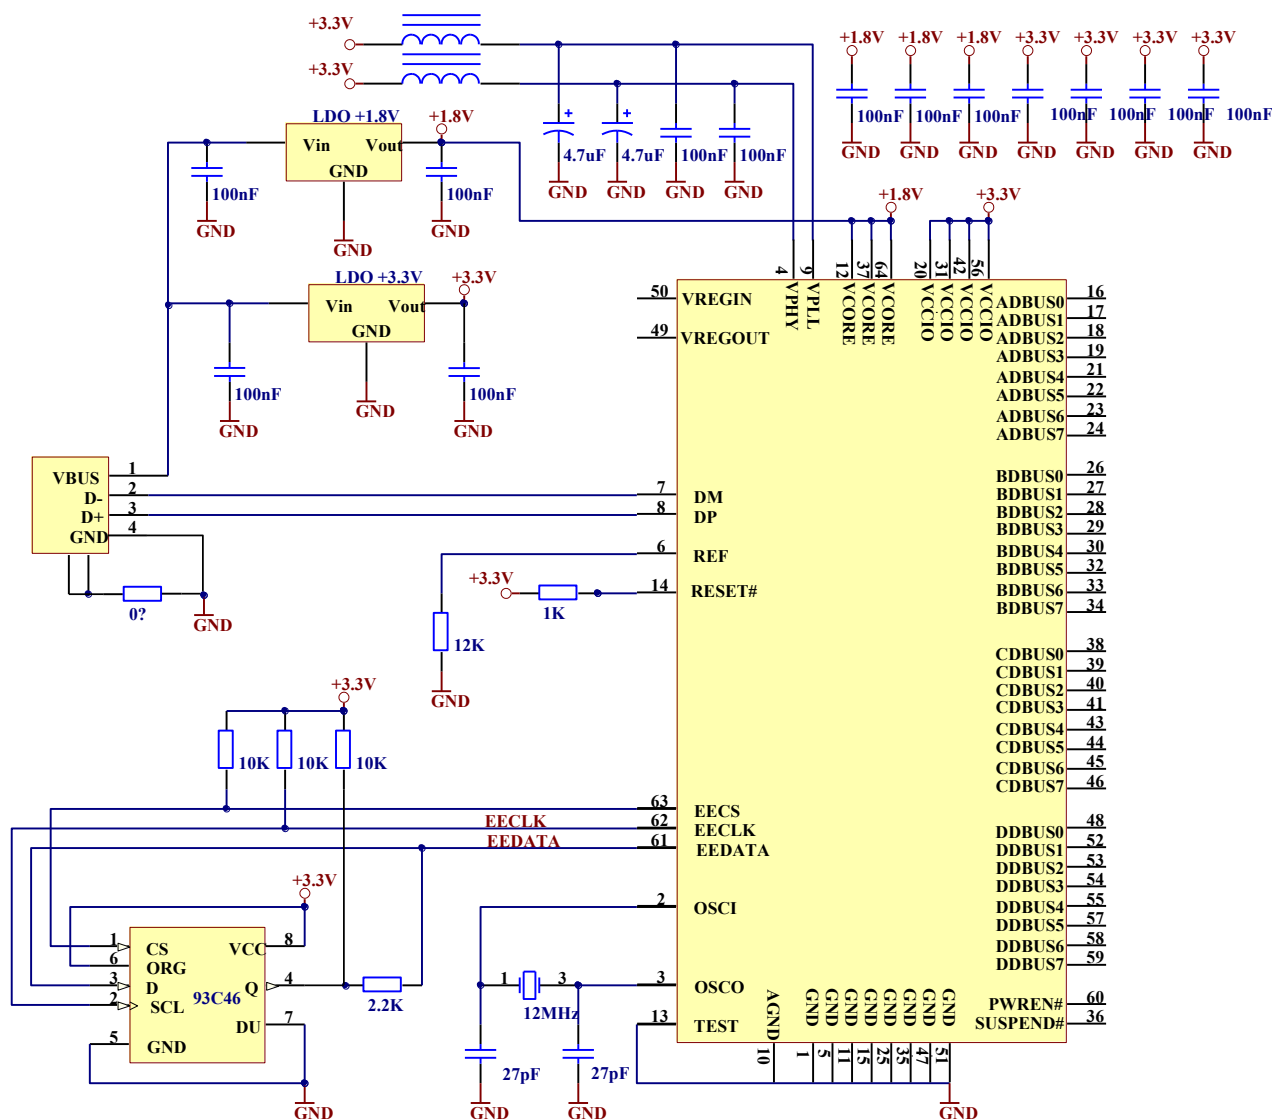

### Figure 6.1 Bus Powered Configuration Example 1

Figure 6.1 illustrates the FT4232H in a typical USB bus powered design configuration. A USB bus powered device gets its power from the USB bus. In this application, the FT4232H requires that the VBUS (USB +5 V) is regulated down to +3.3 V (using an LDO) to supply the VCCIO, VPLL, VPHY and VREGIN.

VREGIN is the +3.3 V input to the on chip +1.8 V regulator. The output of the on chip LDO regulator (+1.8 V) drives the FT4232H core supply (VCORE). This requires a minimum of a 3.3  $\mu$ F filter capacitor.

Bus Powered Application example 2: Bus powered configuration (with additional 1.8 V LDO voltage regulator for VCORE).

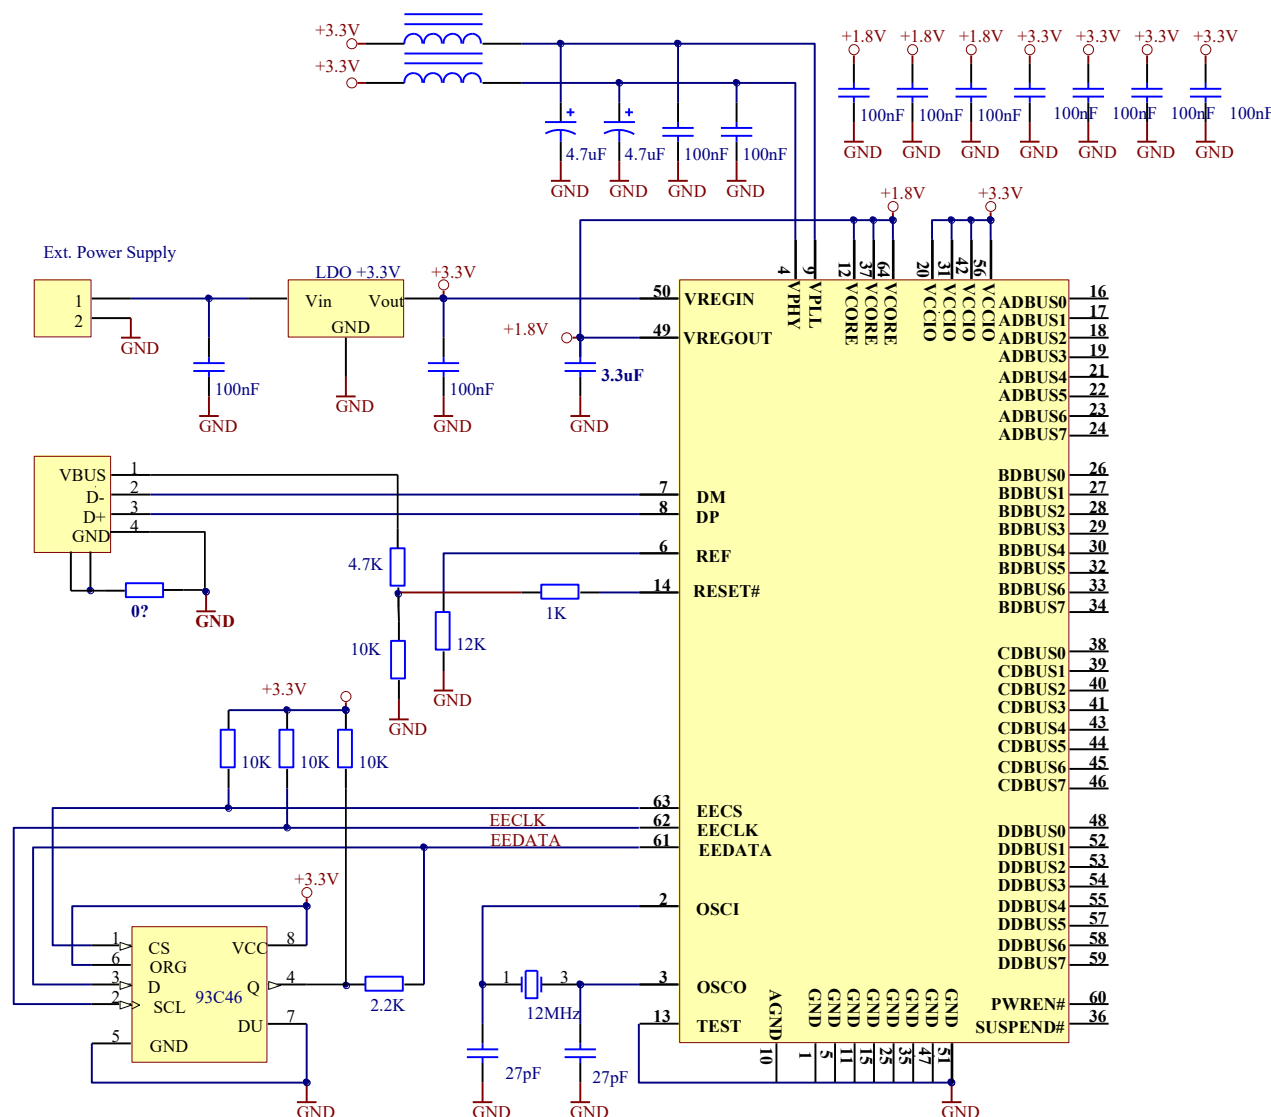

**Figure 6.2 Bus Powered Configuration Example 2**

Figure 6.2 illustrate the FT4232H in a typical USB bus powered configuration similar to Figure 6.1. The difference here is that the +1.8 V for the FT4232H core (VCORE) has been regulated from the VBUS as well as the +3.3 V supply to the VPLL, VPHY, VCCIO and VREGIN.

## 6.2 USB Self Powered Configuration

### Self-Powered application example 1: Self-powered configuration

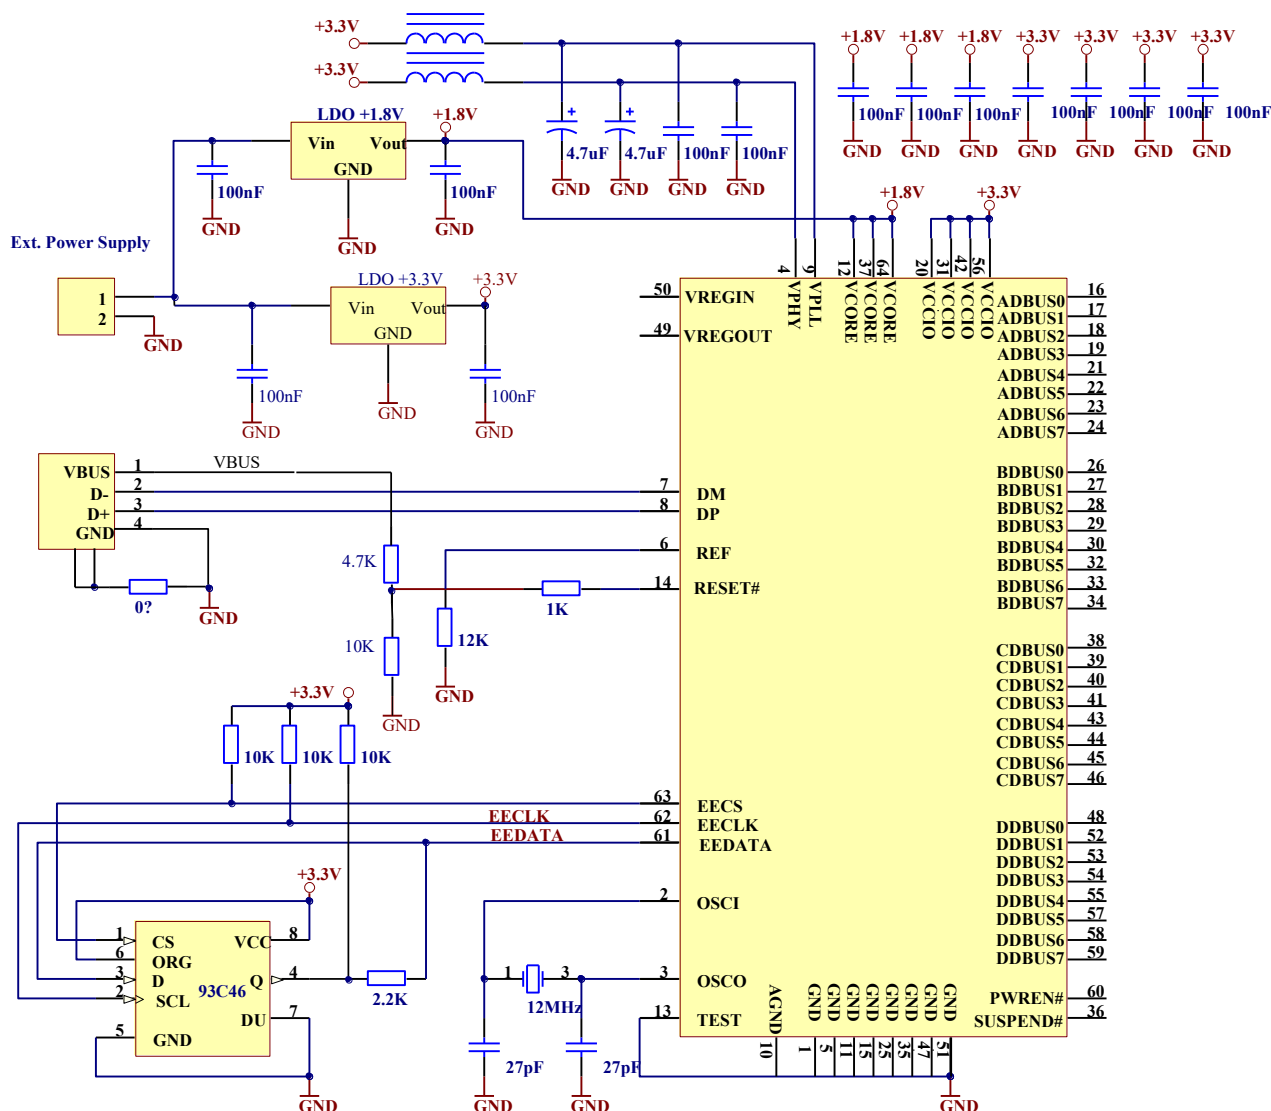

### Figure 6.3 Self-Powered Configuration Example 1

Figure 6.3 illustrate the FT4232H in a typical USB self-powered configuration. A USB self-powered device gets its power from its own power supply and does not draw current from the USB bus. In this example an external power supply is used. This external supply is regulated to +3.3 V.

Note that in this set-up, the EEPROM should be configured for self-powered operation.

Self-Powered application example 2: Self-powered configuration (with additional 1.8 V LDO voltage regulator for VCORE for VCORE).

**Figure 6.4 Self-Powered Configuration Example 2**

Figure 6.4 illustrates the FT4232H in a typical USB self-powered configuration similar to Figure 6.3. The difference here is that the +1.8 V for the FT4232H core has been regulated from the external power supply.

Note that in this set-up, the EEPROM should be configured for self-powered operation.

## 6.3 Oscillator Configuration

**Figure 6.5 Recommended FT4232H Crystal Oscillator Configuration.**

Figure 6.5 Illustrates how to connect the FT4232H with a 12 MHz  $\pm 0.003\%$  crystal. In this case loading capacitors should be added between OSCI, OSCO and GND as shown. A value of 27 pF is shown as the capacitor in the example – this will be good for many crystals, but it is recommended to select the loading capacitor value based on the manufacturer’s recommendations wherever possible. It is recommended to use a parallel cut type crystal.

It is also possible to use a 12MHz oscillator with the FT4232H. In this case the output of the oscillator would drive OSCI, and OSCO should be left unconnected. The oscillator must have a CMOS output drive capability.

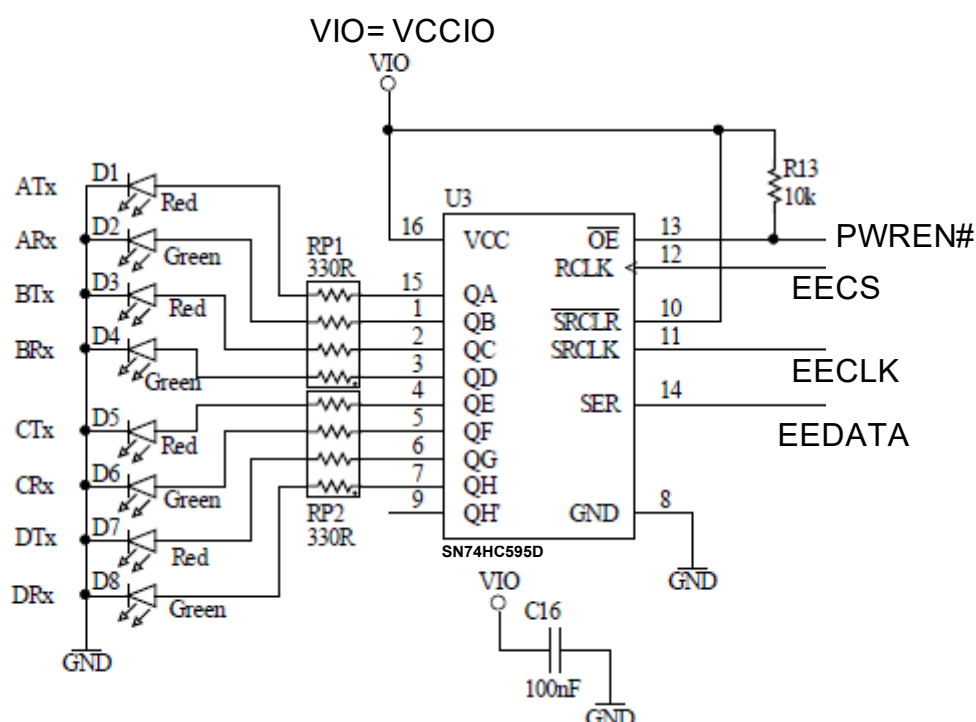

Parameter	Description	Minimum	Typical	Maximum	Units	Conditions
OSCI Vin	Input Voltage	2.97	3.30	3.63	V	
FIn	Input Frequency		12		MHz	+/- 30ppm
Ji	Cycle to cycle jitter		< 150		pS	

**Table 6.1 OSCI Input characteristics**

## 6.4 4 Channel Transmit and Receiver LED Indication Example

The following example illustrates how a 74HC595 can be used to decode the EEDATA data to indicate Tx and Rx on each of the channels. The associated LED will light when the Channel is transmitting or receiving data.

**Figure 6.6 Using 74HC595 to Indicate Tx and Rx Data**

In this configuration, the LEDs will flash when the EEPROM is accessed e.g. during enumeration.

Under normal operation, the EECS is held low to disable access to the EEPROM. In this special case, the EECLK (frequency = 1.56  $\mu$ S) will clock the EEDATA into the 74HC595 shift register (with EECS low, therefore EEPROM ignores the EEDATA). Then EECS will pulse high. The rising edge of the EECS latches the data into a storage register of the 74HC595 which drives the LEDs.

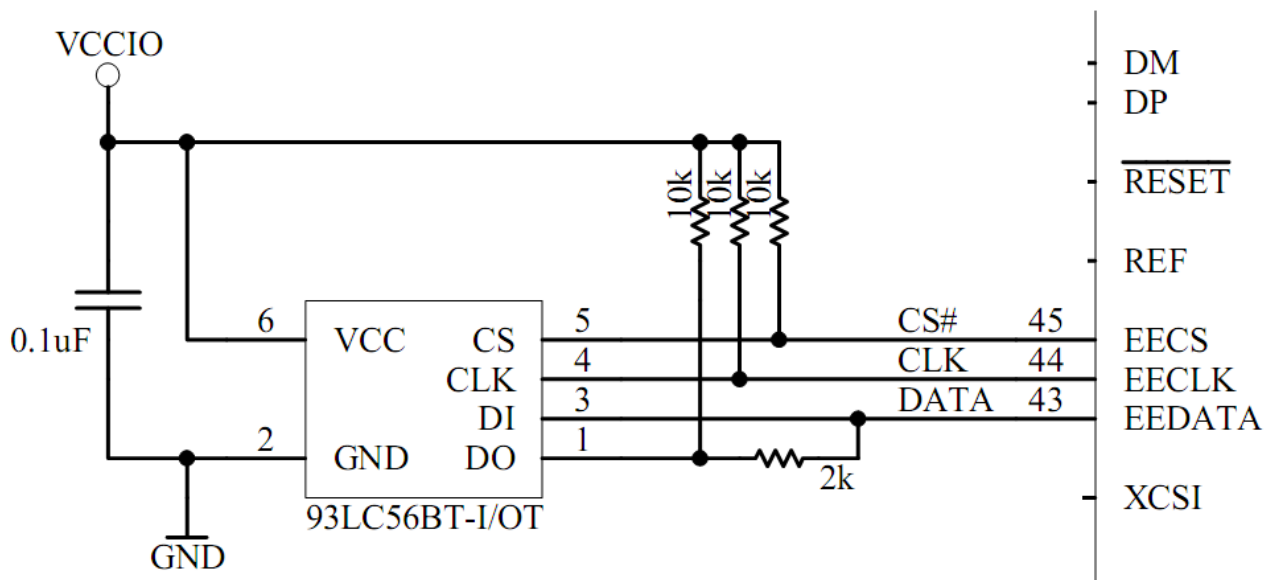

For more information about HC595 products from external suppliers, please refer to the following product pages and note that other suppliers may also exist:

- [Nexperia 74HC595](#)
- [Texas Instrument SN74HC595](#)
- [Diodes Incorporated 74HC595](#)

## 7 EEPROM Configuration

If an external EEPROM is fitted (93LC46/56/66) it can be programmed over USB using [FT\\_PROG](#). The EEPROM must be 16 bits wide and capable of working at a VCC supply of +3.0 to +3.6 volts.

Adding an external EEPROM allows selecting the TXDEN for RS485 mode when asynchronous serial interface has been selected.

**Figure 7.1 EEPROM Interface**

The external EEPROM can also be used to customise the USB VID, PID, Serial Number, Product Description Strings and Power Descriptor value of the FT4232H for OEM applications. Other parameters controlled by the EEPROM include Remote Wake Up, Soft Pull Down on Power-Off and I/O pin drive strength.

If no EEPROM is connected (or the EEPROM is blank), the FT4232H uses its built-in default VID (0403), PID (6011) Product Description and Power Descriptor Value. In this case, the device will not have a serial number as part of the USB descriptor.

### 7.1 Default EEPROM Configuration

The external EEPROM (if it is fitted) can be programmed over USB using [FT\\_PROG](#). This allows a blank part to be soldered onto the PCB and programmed as part of the manufacturing and test process. Users who do not have their own USB Vendor ID but who would like to use a unique Product ID in their design can apply to FTDI for a free block of unique PIDs.

See [TN\\_100 USB Vendor ID/Product ID Guidelines](#) for more information.

Parameter	Value	Notes
USB Vendor ID (VID)	0403h	FTDI default VID (hex)
USB Product UD (PID)	6011h	FTDI default PID (hex)
bcd Device	0800h	
Serial Number Enabled?	Yes	
Serial Number	None	
Pull down I/O Pins in USB Suspend	Disabled	Enabling this option will make the device pull down on the UART interface lines when in USB suspend mode (PWREN# is high).
Manufacturer Name	FTDI	
Product Description	Quad RS232-HS	
Max Bus Power Current	500 mA	

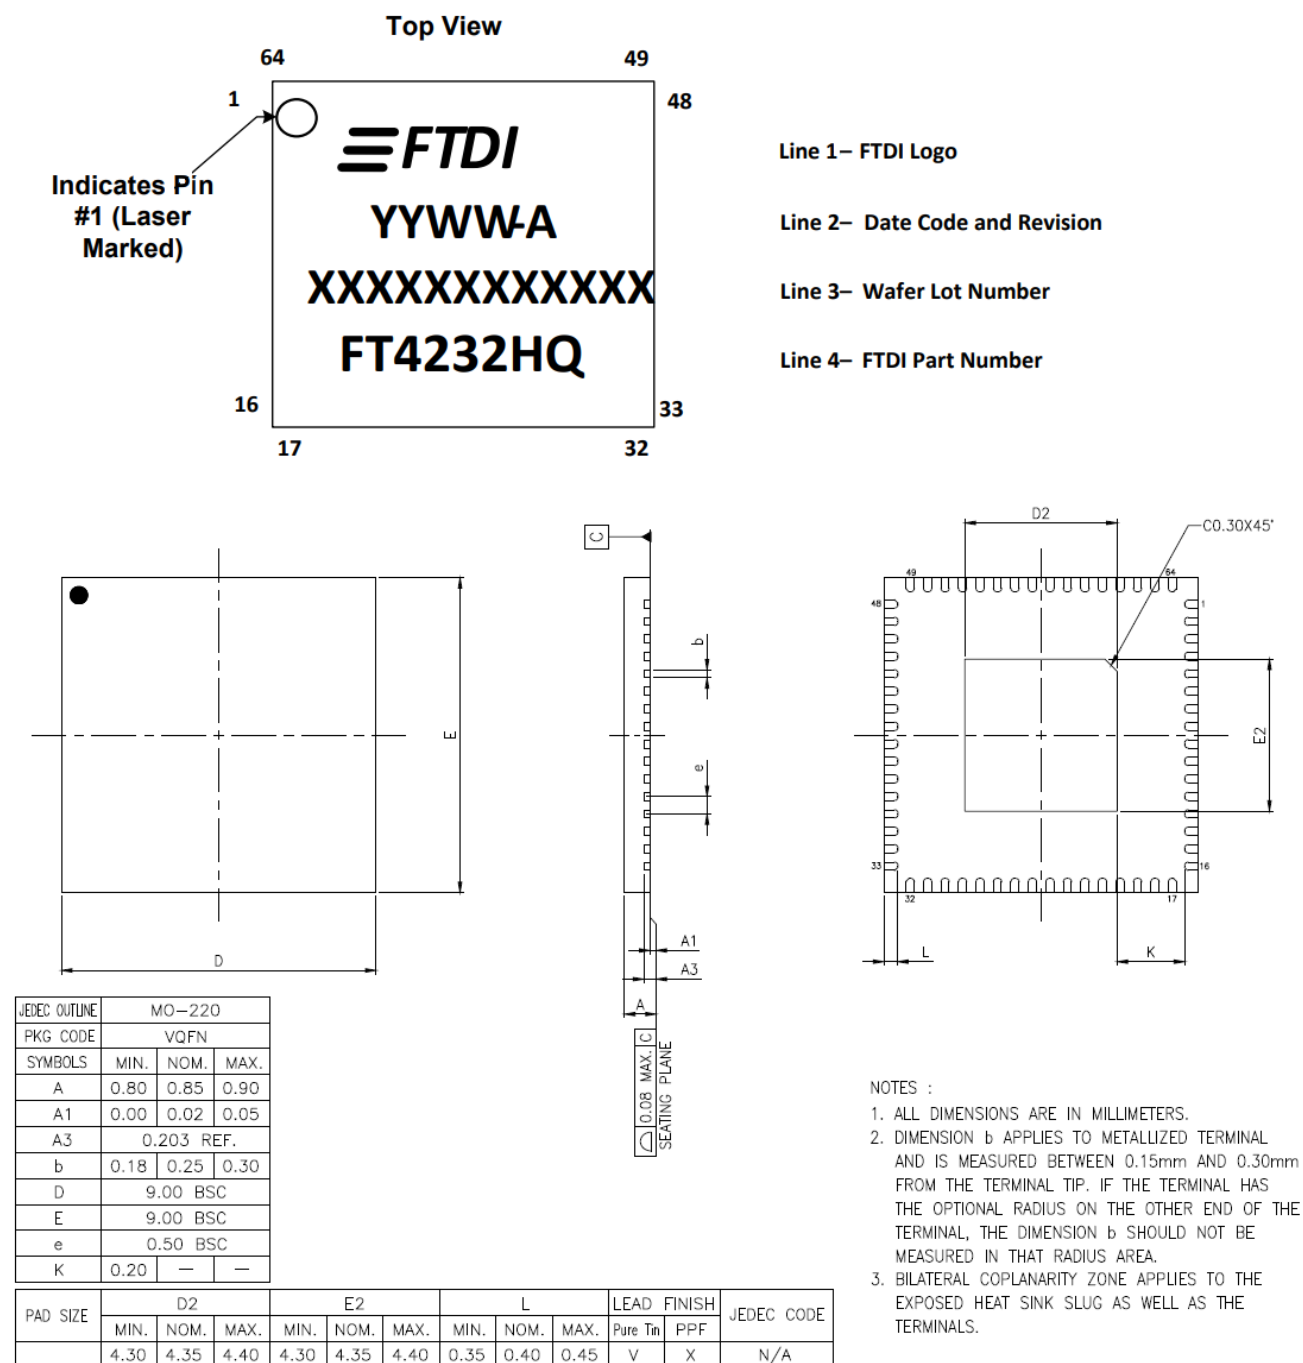

Parameter	Value	Notes
Power Source	Bus Powered	
Device Type	FT4232H	
USB Version	0200h	Returns USB 2.0 device description to the host.
Remote Wake Up	Disabled	Taking RI# low will wake up the USB host controller from suspend in approximately 20ms. If enabled.
RI RS485	Disabled	Enables TXDEN signal for RS485 buses.
High Current I/Os	Disabled	Enables the high drive level on the UART and ACBUS I/O pins.
Load VCP Driver	Enabled	Makes the device load the VCP driver interface for the device.

**Table 7.1 Default Configuration with a blank/no EEPROM**

## 8 Package Parameters

The FT4232H is available in three different packages. The FT4232HL is the LQFP-64 option, the FT4232HQ is the QFN-64 package option and the FT4232H-56Q is the VQFN-56 package option. The solder reflow profile for all packages is described in section 8.4. See [TN 166 FTDI Example IC Footprints](#) for PCB footprint guidelines.

### 8.1 FT4232HQ, QFN-64 Package Dimensions

**Figure 8.1 64 pin QFN Package Details**

#### Notes:

- All dimensions are in mm.
- The bottom side central solder pad must be connected to the ground of the system.

## 8.2 FT4232HL, LQFP-64 Package Dimensions

**Figure 8.2 64 pin LQFP Package Details**

## 8.3 FT4232H-56Q, VQFN-56 Package Dimensions

**Figure 8.3 56-pin VQFN Package Details for FT4232H-56Q**

### Notes:

- The internal ground of the device is connected to the bottom side central solder pad whose dimension is 5.90 x 5.90mm. This central solder pad must be connected to the ground of the system.

## 8.4 Solder Reflow Profile

**Figure 8.4 FT4232H Solder Reflow Profile**

Profile Feature	Pb Free Solder Process (green material)	SnPb Eutectic and Pb free (non green material) Solder Process
Average Ramp Up Rate ( $T_s$ to $T_p$ )	3°C / second Max.	3°C / Second Max.
Preheat - Temperature Min ( $T_s$ Min.) - Temperature Max ( $T_s$ Max.) - Time ( $t_s$ Min to $t_s$ Max)	150°C 200°C 60 to 120 seconds	100°C 150°C 60 to 120 seconds
Time Maintained Above Critical Temperature $T_L$ : - Temperature ( $T_L$ ) - Time ( $t_L$ )	217°C 60 to 150 seconds	183°C 60 to 150 seconds
Peak Temperature ( $T_p$ )	260°C	see Table 8.2
Time within 5°C of actual Peak Temperature ( $t_p$ )	30 to 40 seconds	20 to 40 seconds
Ramp Down Rate	6°C / second Max.	6°C / second Max.
Time for $T = 25^\circ\text{C to Peak Temperature, } T_p$	8 minutes Max.	6 minutes Max.

**Table 8.1 Reflow Profile Parameter Values**

SnPb Eutectic and Pb free (non green material)		
Package Thickness	Volume mm3 < 350	Volume mm3 >=350
< 2.5 mm	235 +5/-0 deg C	220 +5/-0 deg C
≥ 2.5 mm	220 +5/-0 deg C	220 +5/-0 deg C
<b>Pb Free (green material) = 260 +5/-0 deg C</b>		

**Table 8.2 Package Reflow Peak Temperature**

## Appendix C - Revision History

Document Title: FT4232H Quad High-Speed USB to Multi-Purpose UART/MPSSE IC

Document Reference No.: FT\_000060

Clearance No.: FTDI# 78

Product Page: <https://ftdichip.com/product-category/products/ic/>

Document Feedback: [Send Feedback](#)

Revision	Changes	Date
1.0	Initial Release	2008-11-04
2.0	Revised Release	2009-01-05
2.01	Updated description for bit-bang mode	2009-02-05
2.02	Corrected QFN Tray Numbers from 160 to 260 per tray	2009-03-10
2.03	Corrected signal names in Fig2.1; Added reference to AN_109, AN_110, AN_111 & AN_113; Corrected default of RI#/TXDEN in Table 3.1	2009-05-19
2.04	Added latency timer description to Section 4.1	2009-06-03
2.05	Corrected Figures 6.2, 6.3 and 6.4 – missing regulators and better way of holding self-powered designs in reset if not connected to USB; Corrected Max DC inputs on “DC Input Voltage – “All Other Inputs” pins from VCORE+0.5V to VCCIO+0.5V	2009-09-21
2.06	Added description for MPSSE Adaptive Clocking (Section 4.4.1); Corrected 12MHz crystal specification	2009-10-21
2.07	Corrected Section 4.2 – EEPROM description	2009-12-18
2.08	Added TID number (Section 1.3); Added ESD specifications	2010-05-24
2.09	Added USB certified Logo in Section 1.3; Clarified unsupported baud rates of 7,9,10 and 11 Mbaud; Added clarifications about Wake up in Section 3.4.1; Replaced 74HCT595 with 74HC595 in Section 6.4; Edited Fig 4.1 (removed TXLED & RXLED references)	2010-09-02
2.10	Edited Section 4.3.2, 4.3.3 / Fig 4.2 & 4.3	2010-11-17
2.11	Updated Installation guide/App Notes & Technical Notes links	2012-01-09
2.2	Updated Fig 4.1; Added feedback links	2012-02-11
2.3	Updated information for new package 56-pin VQFN	2016-04-04
2.4	Added section Default EEPROM Configuration	2016-06-03
2.5	Added section 5.4 Thermal Characteristics based on customer enquiry. Taken from FT2232H Datasheet. These characteristics are the same for each device. No information on FT4232H-56Q.	2017-11-07
2.6	Updated the following pictures – Figure 8.1, 8.2 and 8.3. Removed table 8.1 (as is now part of the figure). Updated the notes under fig.8.1; Updated the notes under fig.8.3.	2019-05-27
2.7	Updated Driver Support in section 1.1. Updated links about HC595 product pages.	17-05-2024
2.7	Changed 74HCT595 to 74HC595 on page 33	27-05-2024

Revision	Changes	Date
2.8	<p>Added MTTF information to table 5.1.</p> <p>The last sentence in the first paragraph on page 18 implies that VREGOUT is to be connected to VREGIN. This was changed to VCORE.</p>	06-09-2024
2.9	<p>Changes to section 4.4.</p> <ul style="list-style-type: none"> <li>Updated CLKOUT to TCK in paragraph "These show timings for...can be divided..."</li> <li>Updated the figure in Figure 4.4 MPSSE Signal Waveforms</li> <li>Updated t6 in Table 4.1 MPSSE Signal Timings to be maximum rather than minimum.</li> <li>Changed CLKOUT to TCK in Table 4.1 MPSSE Signal Timings under Comment column</li> </ul> <p>Added MTTF to Acronyms and Abbreviations</p> <p>Updated Contact Information page</p>	21-11-2025
